Bucket City Deck Contractors Expands Deck Design and Installation Services

October 09, 2026

Murfreesboro, TN - October 09, 2026 -
Bucket City Deck Contractors has expanded its deck design and installation services, introducing a structured in-house design process and added construction capacity for homeowners planning outdoor projects during the current building season. The expansion brings design consultation, material selection, permitting support, and installation under a single company, a shift intended to simplify how residential decks move from concept to completed structure.

The broadened service replaces the fragmented approach that often requires homeowners to coordinate separately with designers, material suppliers, and installers. Under the expanded model, each project begins with a site assessment and a design consultation that establishes layout, dimensions, and intended use before construction planning proceeds. The company reports that the added capacity is meant to reduce scheduling delays that commonly affect outdoor projects during peak months.

The expansion arrives as spending on outdoor living spaces has grown across the residential remodeling sector, with decks and patios ranking among the improvements homeowners pursue to extend usable living area. A design-and-build structure allows a single team to carry accountability from the first drawing through

final inspection, which can limit the miscommunication that occurs when responsibilities pass between separate firms. That continuity also gives homeowners a clearer view of cost and timeline before work begins.

Industry surveys of home improvement activity have consistently placed deck and outdoor living projects among the categories homeowners fund when expanding usable space, a pattern that has held as remote work increased time spent at home. A structured design phase addresses one of the frequent sources of budget overruns, which is a change in scope after construction has started. By fixing dimensions, materials, and features during design, the process narrows the range of surprises that surface once framing is underway.

Under the expanded services, the company offers composite decking, pressure-treated lumber, and hardwood options, along with railings, integrated lighting, multi-level layouts, built-in seating, and stairs configured to individual sites. Each design accounts for local building codes, load requirements, and permitting, with the aim of producing structures that pass inspection without rework. Material recommendations are matched to factors such as climate exposure, maintenance expectations, and budget rather than a single standard specification.

"The expanded service was built so that one team handles design, materials, and construction from start to finish," said Dave Harris, owner of Bucket City Deck Contractors. "That structure gives homeowners a single point of accountability and a clearer path from the first sketch to a finished deck."

The design process relies on measured drawings and material samples so that homeowners can review layout and finish choices before construction begins. Projects proceed through defined stages that include assessment, design approval, permitting, construction, and a final walkthrough, an approach intended to keep expectations aligned at each step. Harris noted that the staged process was adopted to reduce mid-project changes that raise costs and extend timelines.

The added capacity also positions the company to take on a wider range of project sizes, from compact platform decks to larger multi-level structures with dedicated areas for dining, cooking, and seating. Scheduling has been organized around the seasons when outdoor construction is most active, allowing design work to proceed during colder months so installation can begin once conditions allow. The company indicated that early design planning is the factor that most often determines whether a deck is ready for use by summer.

For homeowners weighing repairs against replacement, the expanded service includes evaluation of existing structures to determine whether an older deck can be reinforced or should be rebuilt. That assessment considers framing condition, fastener integrity, and code compliance, giving property owners documented

information before committing to a direction. The approach reflects a broader emphasis on durability and long-term maintenance rather than short-term appearance alone.

Additional detail on the expanded offering is available through Bucket City Deck Contractors and its project galleries, which document completed layouts and material combinations.
