AG Force Inc. Formally Expands Regional Agricultural Operations with Dedicated Livestock Repairs and Installations

October 15, 2026

October 15, 2026 -
AG Force Inc., an established provider of regional agricultural infrastructure and equipment solutions, has formally announced the expansion of its service capabilities across Story County and the surrounding central Iowa region. The expansion introduces a structured operational division dedicated specifically to livestock repairs and installations in Ames, IA. This initiative is designed to address increasing regional demand for high-quality commercial-grade facility maintenance, structural reinforcement, and specialized mechanical servicing across modern livestock operations.

Agricultural infrastructure in central Iowa operates under heavy daily workloads, variable seasonal stressors, and strict biosecurity and safety standards. Equipment failures, structural wear, and outdated facility layouts can interrupt daily farm workflows, endanger herd health, and introduce operational delays. By establishing a dedicated mobile technician unit and facility installation team based in Ames, AG Force Inc. aims to provide local producers, livestock managers, and agricultural facilities with direct access to scheduled maintenance, structural upgrades, and critical facility repairs.

The newly formalized department encompasses a broad spectrum of services tailored to beef, swine, dairy, and small livestock operations. Service offerings include structural welding and reinforcement for penning, gate systems, and sorting alleys, alongside the alignment, calibration, and repair of automated feeding and watering equipment. Technicians within the division are also equipped to handle the repair, replacement, and installation of facility ventilation controls, curtain systems, manure handling equipment, and load-out chutes. By combining component-level mechanical repairs with complete facility installations, the company provides a single operational point of contact for farm infrastructure lifecycle management.

The expansion also incorporates a structured preventive maintenance framework for area agricultural operations. Routine wear-and-tear inspections, winterization protocols, and pre-season system testing are now available as scheduled service options. These systematic evaluation protocols are designed to identify

potential component fatigue, structural rust, or mechanical alignment issues before equipment failures occur during peak operational cycles. Preventive assessments help prevent costly emergency service calls while extending the overall operational reliability of heavy agricultural equipment.

In addition to physical repair work and system installations, AG Force Inc. is integrating technical consulting into its client engagement process. The company?s service team works with farm managers to evaluate facility layout efficiency, biosecurity access points, and energy usage across automated systems. Findings from these field evaluations will inform upcoming technical bulletins, informational guidance documents, and regional producer workshops hosted by the company. These educational resources will focus on best practices in structural maintenance, livestock facility ventilation optimization, and winter facility preparation, providing local agricultural operators with actionable data to extend the operational lifespan of their capital assets.

The introduction of this service division includes targeted upgrades for older confinement structures and housing facilities. As agricultural regulatory requirements and animal welfare standards evolve, older facilities often require retroactive structural modification to remain compliant and efficient. AG Force Inc. provides custom retrofitting solutions, including frame reinforcement, concrete anchoring repair, and energy-efficient climate control upgrades. These specialized retrofitting services help facility owners modernize existing structures without incurring the capital expense of ground-up new construction.

The complete suite of livestock repairs and installations in Ames, IA is now active and available for scheduling across Story County and surrounding agricultural communities. Farm operators, commercial facility managers, and regional agricultural enterprises seeking to schedule comprehensive facility assessments, request detailed service evaluations, or review custom system installation capabilities can coordinate directly with the company?s regional service division.
