

EAR Customized Hearing Protection Highlights Low-Profile Electronic Earplugs for Shooters and Hunters

November 25, 2026

BOULDER, CO - November 25, 2026 -
EAR Customized Hearing Protection is drawing attention to the practical advantages that low-profile electronic earplugs offer recreational shooters, competitive shooters, and hunters who need to balance hearing protection with environmental awareness. The company points to its SHOTHUNT STANDARD, a universal-fit electronic hearing protection system, as an example of how a compact in-ear design can serve shooters across a range of settings.

Unlike traditional passive protection such as foam plugs and standard muffs, which reduce nearly all sound, electronic systems amplify quieter sounds while limiting damaging impulse noise. This approach supports situational awareness in shooting environments, where hearing commands, conversations, and surrounding movement can contribute to safer handling of firearms.

The physical design of in-ear electronic protection addresses challenges that some users encounter with

over-the-ear muffs. By reducing bulk around the head, low-profile earplugs can avoid interference between earmuff cups and a firearm stock when a shooter shoulders a rifle or shotgun. This can allow for a more consistent cheek weld and mount. The in-ear form factor also tends to work alongside shooting glasses and headwear, though the company notes that comfort depends on individual fit and proper insertion.

The SHOTHUNT STANDARD is a universal-fit product rather than a custom-molded device, meaning it is designed to accommodate a broad range of users. Its compact physical design is distinct from its electronic sound-management functions, which handle the amplification of ambient sound and the limiting of loud impulse noise. The company emphasizes that these are separate considerations when evaluating any hearing protection.

"Shooters often assume that a smaller device must offer less protection, or that any electronic plug will perform the same in every situation," said Garry Gordon, President of EAR Customized Hearing Protection. "The reality is more nuanced. Fit, correct use, and matching the product to the activity matter just as much as the technology inside."

EAR Customized Hearing Protection cautions that smaller size does not automatically translate to greater noise reduction. Protection depends on a device's rated performance, correct fit, proper use, and the specific shooting conditions involved. No single device is suitable for every setting, and earplugs alone cannot be assumed to provide adequate protection in all environments or to eliminate the risk of hearing damage.

Gordon added that the in-ear design serves a specific practical need for many shooters. "When someone shoulders a long gun, an over-the-ear muff can get in the way of a clean mount. A low-profile earplug removes that interference while still managing sound electronically, which is why many hunters and competitive shooters gravitate toward the format."

The company encourages users to select hearing protection based on their particular environment and activity, and to understand the differences between product types before making a decision.

EAR Inc. provides hearing protection solutions worldwide, serving industrial, shooting, law enforcement, and leisure markets. Based in Boulder, Colorado, the company focuses on delivering comfort, performance, and proven hearing protection for a wide range of users and applications.
