

Texas Foundation Pros Expands Foundation Repair Service In Frisco, TX

March 11, 2019

March 11, 2019 - PRESSADVANTAGE -

Texas Foundation Pros (TFP) is pleased to announce that they recently expanded their building foundation repair services to Frisco, TX and its surrounding areas.

"TFP is a licensed general contractor specializing in geotechnical issues related to foundations, retaining walls, beams, and other structural elements. Our years of experience in building construction allows us to deliver fast and unmatched results, thus giving Frisco residents the assurance that any kind of damage to their home's foundation will be professionally repaired," said John Sirent from Texas Foundation Pros.

As noted on the company's website at <https://txfoundationpros75034.business.site>, foundation damages are usually caused by a number of external factors, including an earthquake or tremor, prolonged droughts, poor drainage systems, uncompacted soil, water leaks, and drastic changes in weather. Sirent explained that in most cases, water within the soil creates resultant movements that disturb the foundation and causes it to shift from its original position. He said that these movements, or shifts, cause stress to the steel and concrete. This is how sinking, settling, and cracking of the foundation takes place.

He further advised homeowners to ensure that their water drains are far from the foundation of the house and that there is a good drainage system in their homes. "Landscaping can be utilized to help absorb residual water, and regular plumbing inspections can also help to detect water leaks before they cause any further damage to foundation of the house," he said.

In order to avoid the more costly repairs of serious foundation problems, it's always best to look for early warning signs pointing to the need for foundation repair. Sirent explained that homeowners should check their house for any visible cracks in the foundation itself, vertical or horizontal cracks on the interior walls, cracks in the basement or garage walls, visible sinking or upheaval of the foundation, uneven floors, and misaligned windows and doors. "Minor cracks are typically normal and should not be a cause of major concern, but visible cracks should be tended as soon as possible. Big cracks indicate signs of significant movement and may influence the building's structural soundness," he said.

Meanwhile, Sirent explained that home foundation repair is best carried out by a licensed contractor because they are the only ones who can properly assess the extent of the damage and recommend the most suitable mitigation method. "By hiring a professional contractor, you can rest assured that your house will be safe and structurally sound, and will pass any inspection test in the event that you need to sell it in the future," he said.

Those looking for a licensed contractor in Frisco, TX and its surrounding areas of <https://goo.gl/maps/pdKYVYoZ78w> may reach out to TFP by visiting their website or calling their company hotline. Their professional services include mudjacking, slab foundation repair, and pier and beam foundation repair.

Sirent said that homeowners can shortlist a number of reliable contractors in their area by seeking recommendations from their friends and families, or utilizing the help of online review platforms including the Better Business Bureau (BBB), Google, and Yelp. He also recommended looking for a contractor who is properly licensed and insured to ensure everyone's safety as well as protect the property from any damages. In addition, he encouraged homeowners to look for second and third opinions before committing to a contractor. "By having a number of options, you will be able to select the best repair team for your needs. Always bear in mind that quality comes at a price so if an offer is too good to be true, it probably is," he said.

"Ultimately, hiring an experienced contractor to execute foundation repairs can make your home safer and more structurally sound. When it comes to foundation repair, time is also of the essence because foundation cracks don't go away on their own. Instead, the problem only gets worse over time, especially in Texas where the weather can be extremely unpredictable. Getting the foundation repaired at the first sign of trouble not only prevents more cracks from forming but also helps you to save more money in the long run," Sirent said.
