

Richardson Pain & Wellness Combats Low T In Men With New Testosterone Replacement Therapy

July 29, 2019

Richardson, TX - July 29, 2019 - PRESSADVANTAGE -

Richardson Pain & Wellness is launching a new cutting edge testosterone replacement therapy clinic in Richardson, Texas for men with "Low T". This medically supervised testosterone therapy is customized to the needs of each individual. As men age their testosterone levels decline. Many men in Richardson, Texas find that hormone replacement therapy with testosterone makes them feel better, feel younger and adds vigor to their lives. Richardson Pain & Wellness has stepped up to provide a solution to a common problem facing men in Texas today as they age.

"If tests show that you do have low T and the condition is interfering with your health and quality of life, then you may be a candidate for hormone replacement therapy in Richardson with the goal of supplementing the body's production of testosterone to levels of young adulthood. Replacement therapy may lead to desired results, such as greater muscle mass and a stronger sex drive. But beware?supervised testosterone therapy to treat low T is vital. Mental and physical risks may develop with self-administered artificial or synthetic testosterone, also called anabolic steroids," says Richardson Pain & Wellness.

Testosterone is a male sex hormone that is important for sexual and reproductive development. The National

Institutes of Health regards testosterone as the single most important male hormone. While women also produce testosterone, they do so at much lower levels than men. As soon as age 30, many men may start to experience a gradual decline in testosterone levels. This decline in testosterone levels can cause a decrease in sex drive and lead many men to mistakenly believe that their loss of interest in sex is simply part of getting older.

"The American Urological Association states that if testosterone decreases more than normal, then men may experience several different symptoms. Low testosterone, or low T, is diagnosed when levels fall below 300 nanograms per deciliter (ng/dL). A normal range is typically between 300 and 1000 ng/dL, according to the U.S. Food and Drug Administration. A blood test called a serum testosterone test is used to determine the level of circulating testosterone. Signs of low T are often subtle and include decreased sex drive, a lack of energy, weight gain, depression and moodiness, a lack of confidence and low self-esteem, loss of body hair and bone thinning," says The American Urological Association.
