

Pest Control Company in Irvine, CA Fighting Earwigs

April 17, 2020

April 17, 2020 - PRESSADVANTAGE -

Earwigs are a common insect issue in the Irvine, CA area and typically live in secluded, moist places including underneath boards or stones and rocks. During the spring rains is typically when these particular pests emerge throughout Orange County, California. Excellent Pest Control of Irvine is offering superior earwig extermination services to local properties.

"Earwigs create their nests in places that can be flooded out, so when the rain comes, we start noticing the earwigs more. We always recommend that property owners take preventative measures prior to spring and summer time, but the insects aren't always noticed in time. When that happens, we can still help," the business manager said.

Earwigs eat small insects and seedlings and they can lay eggs wherever they nest; under rocks or yard debris, in the cracks of concrete, etc. While typically an issue outdoors, they can find their way inside a property and then they can really be a disruption.

When earwigs make their way inside they're unsettling to look at, but their diet consists of vegetation and small insects. Therefore, they are not going to cause a lot of damage, but that doesn't make them any easier to look at or live with.

?Our Irvine earwig exterminators can help property owners treat the existing earwigs and then offer prevention tips or strategies for keeping them out of the property, as well as treating and preventing those outside,? the manager at Excellent Pest Control of Irvine, CA said.

?If you have a garden or flowerbeds outdoors you could definitely experience an earwig invasion. Luckily, we can help you protect your vegetation with superior treatments,? the manager added.

To schedule services for earwig control or to learn more about the services offered by Excellent Pest Control of Irvine, property owners can visit pestcontrol-irvine.com or contact the company by phone.
