Cherry Hill Pain Management Facility, North American Spine & Pain, Adds PRP Injections to Treatment Offerings

May 29, 2025

May 29, 2025 - PRESSADVANTAGE -

Cherry Hill, NJ ? May 7, 2025 ? North American Spine & Pain, a premier pain management facility serving Cherry Hill and the surrounding communities, has announced the expansion of its treatment portfolio to include cutting-edge Platelet-Rich Plasma (PRP) injections. This innovative addition reflects the center?s ongoing commitment to offering advanced, non-surgical options for patients seeking long-lasting relief from musculoskeletal pain and injuries.

PRP therapy, derived from a patient's own blood, utilizes concentrated platelets and growth factors to accelerate the body?s natural healing processes. By incorporating this regenerative approach, North American Spine & Pain now provides a powerful option for conditions such as tendonitis, arthritis, ligament injuries, joint pain, and post-surgical recovery.

?At North American Spine & Pain, we are always seeking new solutions that align with our

mission?relieving pain, restoring function, and enhancing quality of life,? said Dr. Kieran Slevin, Medical Director and Interventional Pain Specialist at the facility. ?PRP therapy allows us to treat the root cause of musculoskeletal conditions by stimulating tissue regeneration and healing, not just masking symptoms. This is a game-changer for many of our patients who want to avoid surgery or reduce dependence on medications.?

The facility is utilizing the Arthrex ACP® and ACP Max? Platelet-Rich Plasma Systems, recognized industry-wide for their closed-system design, superior platelet concentration, and quick preparation time. Unlike conventional PRP methods, the Arthrex systems exclude inflammatory white blood cells?particularly neutrophils?which can sometimes delay healing. The result is a highly pure and potent PRP product, administered in a matter of minutes at the point of care.

Key benefits of PRP injections using the Arthrex ACP Max? system include Reduced Inflammation and Pain: Concentrated platelets release anti-inflammatory proteins and growth factors that help repair damaged tissues naturally.

Faster Recovery: PRP enhances the healing timeline by delivering regenerative elements directly to the affected area.

Minimally Invasive: The outpatient procedure requires only a small blood draw and injection?no anesthesia, no incisions.

Low Risk of Adverse Reaction: Since PRP is derived from the patient?s own blood, the risk of allergic reactions or complications is extremely low.

Enhanced Outcomes for Chronic Pain: Studies and patient outcomes show lasting relief for conditions like osteoarthritis, rotator cuff injuries, plantar fasciitis, and degenerative joint disease.

The addition of PRP injections further strengthens North American Spine & Pain?s role as a regional leader in multidisciplinary pain management. Alongside spinal injections, physical therapy, and advanced diagnostics, the center now offers one of the most comprehensive non-surgical pain solutions in the South Jersey area.

?Our Cherry Hill office is equipped to deliver a full spectrum of advanced pain management services?from image-guided spinal injections and nerve blocks to regenerative treatments like PRP. We personalize every care plan using cutting-edge diagnostics and evidence-based therapies, ensuring that each patient receives the right treatment at the right time for meaningful, lasting relief. Whether you're dealing with acute injury or chronic pain, our multidisciplinary approach is designed to restore mobility, reduce reliance on medication,

and improve overall quality of life,? says Dr. Kieran Slevin, Medical Director, North American Spine & Pain.

Patients interested in PRP therapy can schedule a consultation at North American Spine & Pain?s Cherry Hill office to determine if they are a candidate. The initial evaluation includes a full diagnostic assessment to tailor the PRP treatment plan to each individual?s needs and health history.
