

National Alloy Solutions Now Offers Arc Spray Systems

January 05, 2016

January 05, 2016 - PRESSADVANTAGE -

National Alloy Solutions, a business in Porter, TX, has recently started offering thermal spray systems. The announcement was made in a blog post that also provides people with information on how to find the best arc spraying business. While still a new service, customers have already started coming to National Alloy Solutions for their spray.

"It is vital that businesses choose the right arc spray solution for their product, in order for it to be of the best quality," says Charles Felchak from National Alloy Solutions. "We recommend that people spend some time shopping around and doing their research on the systems that are out there and what differentiates them so that they can find the one most suitable to their particular needs."

Arc spray is a type of thermal spraying technique that should only be completed by a trained expert. An electrical heating melts the material that is then sprayed on products made from substances such as stone and metal. Once applied and dried, it creates a solid coating. Other solutions include chemical coating and plasma coating, but arc spraying is by far the most popular method.

Arc spray is popular because of its high quality. The coating bonds on a molecular level, which is what enables it to create such a beautiful finish that doesn't fade or chip. However, this is only possible if it is

completed by someone who knows exactly what they are doing, and who has the skills and knowledge to properly use an arc sprayer. They must understand how to get the maximum possible velocity out of the sprayer.

The company has also released a video on thermal spray technologies and coating. The video clearly highlights the various types of technologies that National Alloy Solutions offers and why these are superior to any other. This also links in to the original blog post, encouraging people to research the options that are out there for them. "A small operation may not need the same type of system as a much larger one," adds Charles Felchak. "By making sure that you know what to look for, you can find the right arc spray system at a very fair price."
