

Sambursky Eye & Esthetics Introduces Revolutionary Light Adjustable Lens

April 17, 2024

April 17, 2024 - PRESSADVANTAGE -

Johnson City, NY ? Sambursky Eye & Esthetics, a leader in eye care and aesthetic services in the Southern Tier region, is proud to announce the availability of the light adjustable lens, a cutting-edge solution in the realm of cataract surgery. This innovative technology offers unprecedented customization in vision correction, promising patients a level of clarity and precision previously unattainable with traditional fixed lenses.

Cataracts, a condition where the eye's natural lens becomes clouded, are a leading cause of vision impairment among adults. The standard treatment involves replacing the clouded lens with a synthetic one. Traditionally, this has meant using fixed lenses, which require decisions about vision preferences to be made prior to surgery. However, the light adjustable lens changes this paradigm by allowing adjustments to be made post-surgery, ensuring each patient's vision can be fine-tuned to their specific needs.

The light adjustable lens is designed using a unique photosensitive material that reacts to ultraviolet (UV) light. After the lens is implanted and the eye has healed, the patient undergoes a series of light treatments. These treatments precisely adjust the shape and focus of the lens, targeting the patient's optimal vision. This process not only enhances the accuracy of vision correction but also significantly increases the likelihood of achieving 20/20 vision or better without the need for glasses.

"Introducing the light adjustable lens at our center marks a monumental step forward in personalized eye care," said Dr. Daniel Sambursky, founder of Sambursky Eye & Esthetics. "This technology aligns perfectly with our commitment to providing the most advanced and effective solutions to our patients. We're now able to offer a truly customized vision correction experience that adapts to each individual's unique lifestyle and vision requirements."

Patients opting for the light adjustable lens will undergo one to three UV light treatments to adjust their vision,

followed by two lock-in treatments that finalize the adjustments. This process begins approximately three weeks after surgery, once the eye has sufficiently healed. To protect the lens during the adjustment phase, patients are required to wear special UV-protective glasses, ensuring the stability of the lens adjustments until they are locked in.

"Seeing clearly is a vital part of life, and with the light adjustable lens, we can ensure our patients not only see well but achieve the best vision possible," Dr. Sambursky said. "Our team is excited to be at the forefront of adopting this revolutionary technology, reinforcing our position as the leading eye care provider in the region."

The introduction of the light adjustable lens at Sambursky Eye & Esthetics represents a significant advancement in the field of ophthalmology and a leap forward in patient care. By combining state-of-the-art technology with personalized treatment plans, Sambursky Eye & Esthetics continues to set the standard for excellence in eye health and vision correction.
