

Sarkinen Industrial Pipelining Revolutionizes Pipeline Industry with Innovative CIPP Pipe Lining Technology

March 24, 2025

VANCOUVER, WA - March 24, 2025 - PRESSADVANTAGE -

Sarkinen Industrial Pipelining is starting a new initiative to boost the durability and efficiency of pipeline systems using CIPP pipe lining technology. Known for high-quality services, the company offers advanced solutions for pipe repair, lining, and inspections throughout Washington and Oregon. This move is part of Sarkinen's ongoing effort to integrate the latest technology in its services, aiming to provide top-level solutions to a wide range of clients, including both governmental and commercial sectors.

CIPP, which stands for Cured In Place Pipelining, is a modern method that repairs pipelines without the need for extensive digging. This technique rehabilitates pipes from 4 to 24 inches in diameter using UV or steam curing. Sarkinen Industrial Pipelining uses this to extend the lifespan of damaged or failing pipes with minimal disruption. By using this method, the company shows its commitment to offering sustainable and efficient infrastructure solutions while reducing environmental impact and limiting operational downtime for customers.

Alongside CIPP, Sarkinen Industrial Pipelining continues to provide services like video inspections and

commercial jetting. High-definition CCTV inspections are important for thorough pipeline evaluations. These inspections use advanced camera technology to spot issues such as blockages and cracks, helping in planning effective solutions tailored to each project's specific needs.

Commercial hydro-jetting techniques complement these services. This powerful method efficiently cleans storm, sewer, and wastewater systems using high-pressure jets to clear obstructions and maintain optimal pipe function. This service is particularly useful for maintaining large-scale facilities, ensuring infrastructure stays in excellent condition.

One happy customer, Karlie Ramirez, praised Sarkinen Industrial Pipelining for its technological expertise and efficient methods. She commended the company's ability to handle large projects with minimal disruption. Her feedback highlights the firm's consistent ability to meet client expectations, building a solid client base.

"Sarkinen Industrial Pipelining is leading the way in changing traditional pipe repair methods with advanced, non-intrusive technologies," said a company representative. "Our aim for excellence and innovation is clear in our use of CIPP lining and other cutting-edge solutions. These are crafted to meet our clients' changing needs, ensuring reliability and effectiveness in everything we do."

The company also provides robotic pipeline cutting services using Schwalm systems, offering a no-dig approach to removing obstructions like concrete or steel without excavation. Additionally, Sarkinen uses advanced techniques for trenchless mainline repairs and jetting, including steam curing, UV spot repairs, and T-Liners to fix lateral connections.

Safety is a top priority for Sarkinen Industrial Pipelining, as shown by their compliance with industry safety standards. The team is certified in LightRay? technologies and CIPP rehabilitation, and they use sophisticated robotic systems. Their adherence to OSHA regulations further emphasizes their commitment to safe operational procedures.

By introducing their CIPP pipe lining initiative, Sarkinen Industrial Pipelining continues to innovate and adapt to meet industry needs. This advancement not only enriches their service offerings but also strengthens their position as a leader in the field. Their commitment to using new, efficient technologies ensures clients receive top-notch service, reinforcing the company's great reputation in the industry.
