

Royce Integrated Solutions Expands Access Control Systems Offerings

August 11, 2026

POMPANO BEACH, FL - August 11, 2026 -

Royce Integrated Solutions, a family-owned security and perimeter management company with over 50 years of industry experience, has officially expanded its operational footprint to offer access control systems installation in Miami, FL. Holding multiple state credentials, including a Certified General Contractor license (CGC1512682) and a Certified Alarm System Contractor II license (EG13000565), the company delivers specialized entry solutions for commercial facilities, multi-family complexes, homeowners associations, and new construction developments. With this geographic expansion, the company provides regulated entry points for stakeholders operating in high-traffic South Florida corridors. The expansion aligns with ongoing commercial development throughout the metropolitan area, where secure facilities are frequently prioritized during architectural planning. By establishing a dedicated market presence, the firm intends to streamline the consultation and installation process for both new builds and retrofits. The firm accommodates the demographic landscape by employing bilingual, Spanish-speaking personnel, facilitating technical communication during initial deployment phases and ongoing service calls.

The integration of controlled entry mechanisms provides a structured approach for property owners seeking to mitigate unauthorized access and manage logistical vulnerabilities. By transitioning from traditional keyed

locks to electronic frameworks, facilities can log entry times, update access privileges remotely, and streamline traffic flow during peak hours. Replacing physical keys with digital credentials eliminates the need to re-key exterior doors after employee turnover or tenant evictions. When installing access control systems, Royce Integrated Solutions uses equipment from established manufacturing partners such as LiftMaster, Chamberlain, Doorking, Linear, and FAAC. These partnerships enable the deployment of diverse access frameworks, ranging from basic proximity card readers and radio-frequency identification (RFID) scanners to telephone entry systems and barcode scanning arrays. Such hardware allows administrators to establish tiered access zones, intended to help property managers mitigate internal security risks by restricting personnel to designated areas.

In addition to installing standardized card and fob readers, the firm's technical teams fabricate custom gates and fencing in-house to complement electronic entry points. This vertical integration is designed to ensure that swing gates, slide gates, and perimeter barriers align with the integrated access technology, addressing the compatibility issues that can arise when utilizing multiple third-party vendors for a single project. The access systems are configured to function alongside closed-circuit television (CCTV) surveillance arrays. By capturing video evidence alongside credential verification, properties can maintain auditable logs of individuals and vehicles crossing their thresholds.

To support continuous operation, Royce Integrated Solutions employs factory-trained technicians capable of handling both primary installations and subsequent infrastructure maintenance. Recognizing that perimeter security represents a primary operational requirement for many facilities, the company provides twenty-four-hour emergency repair services, addressing mechanical failures or software glitches, even on weekends. Regularly scheduled maintenance plans are also available to identify mechanical wear on heavy sliding gates, hinges, and electronic components. This proactive diagnostic approach is intended to preserve the operational lifespan of the hardware.

As South Florida continues to experience commercial and residential development, perimeter oversight remains a logistical consideration for architects and property managers. The availability of professional access control systems installation in Miami, FL, offers local stakeholders a method for regulating human and vehicular traffic. Drawing upon its established operational history, state-certified licensing, and partnerships with hardware manufacturers, Royce Integrated Solutions implements these entry systems for regional property developers. The company supplies physical access hardware configured to accurately log and manage daily site entries. This physical infrastructure specifically assists building administrators in documenting pedestrian and vehicle movement without relying on manual oversight.
