All Pro CS Decks Expands Deck Design and Installation Services

October 05, 2026

COLLEGE STATION, TX - October 05, 2026 -
All Pro CS Decks has broadened its deck design and installation services across College Station, Texas, and the surrounding Brazos Valley, adding a wider range of materials, structural configurations, and outdoor living features for residential clients. The expanded offering consolidates material selection, design, permitting, and construction into a single managed process handled by one contractor.

The scope now spans five primary decking materials, each carrying a distinct cost and maintenance profile. Pressure-treated lumber remains a lower-cost option that can last for decades with annual refinishing, while cedar and redwood typically deliver a service life of 15 to 20 years with periodic upkeep. Polyvinyl chloride and composite decking round out the selection, with composite combining wood fiber and recycled polyethylene to reduce routine maintenance and resist Texas humidity.

Alongside material choices, the expanded service covers a broader set of structural designs. These include full covered decks finished with a pergola or roof, multi-tier stacked decks that step down toward a yard or patio, pool decks, and built-in benches and counters that add seating and surface space without separate furniture. The configurations are intended to fit varied lot sizes, including challenging or sloped properties that

require linked outdoor areas.

"The expanded service brings material selection, design, permitting, and installation together under a single contractor, which reduces uncertainty for homeowners planning a custom deck," said Hector Garcia, owner of All Pro CS Decks. "Demand across the Brazos Valley has grown for outdoor space that holds up to Texas weather, and a broader range of materials and configurations gives residents more ways to match a deck to a specific property and budget."

Project timelines under the expanded service generally run one to three weeks for a standard deck, following an initial consultation, design approval, and material selection. Pricing for basic wood decks typically begins near 20 to 30 dollars per square foot, with composite and fully customized builds priced higher based on scope. The company states that it is licensed and insured and manages permitting and compliance with College Station building codes and homeowners association guidelines as part of each project.

Under the broadened program, projects begin with a consultation in which designers review a client's goals, budget, expected deck longevity, and any prior experience with outdoor construction. The company describes this step as the point where size, scope, materials, and options are set before work begins, an approach intended to reduce mid-project changes.

The material options carry differing environmental and upkeep considerations. Pressure-treated decking shifted away from arsenic-based preservatives in 2004 toward copper-based formulas, and composite surfaces call for cleaning every three to four years to prevent mold in the wood-fiber content. Redwood and cedar rely on heartwood selection for decay resistance, a factor the design stage accounts for when a client weighs appearance against long-term maintenance.

The expanded service reaches beyond College Station to neighboring communities that include Bryan, Brenham, Caldwell, and Navasota. Coverage of these areas reflects the firm's stated focus on residential outdoor construction throughout the Brazos Valley rather than a single municipality.

Beyond freestanding decks, the expanded program connects to related outdoor structures the company builds, including porches, patios and hardscape, pool decks, and pergolas or shade structures. Linking these elements allows a single deck project to extend into a broader outdoor layout when a property and budget allow, with each addition specified during the design stage rather than added after construction.

Optional features available within the expanded service include screened enclosures that limit insects on covered decks, integrated lighting and ceiling fans, gas or wood fireplaces, and connections to in-ground or above-ground spas. The firm also pairs new installation with deck repair and restoration, addressing issues such as mold that can affect composite surfaces when cleaning intervals are missed.
