

Best Roofing & Siding Company Expands James Hardie and Vinyl Siding Services

August 24, 2026

WORTHINGTON, OH - August 24, 2026 -

Best Roofing & Siding Company is expanding its siding installation capacity across Central Ohio, increasing access to James Hardie fiber cement siding and vinyl siding installation for homeowners throughout the company's service area. The expansion strengthens the company's ability to accommodate siding projects involving exterior replacement, remodeling, weather-related deterioration, and other residential property improvement needs.

Best Roofing & Siding Company's siding services expansion include siding installation and siding repair using either James Hardie fiber cement siding or vinyl siding. The two materials have different characteristics, installation requirements, and maintenance considerations, making material selection an important part of the siding replacement process. Project requirements, existing exterior conditions, architectural considerations, and homeowner preferences can all influence which siding material is appropriate for a particular property.

Siding plays a significant role in protecting a home's exterior from weather exposure while also contributing

to the property's overall appearance and condition. James Hardie fiber cement siding is manufactured from a combination of cement, sand, and cellulose fibers and is commonly used for residential exterior applications. The material is available in multiple profiles, textures, and finish options, allowing siding projects to accommodate a range of architectural styles. Its use in residential construction has also made fiber cement siding a recognized option for homeowners comparing durability, appearance, and maintenance considerations.

The expansion also addresses siding projects involving homes with aging or damaged exterior materials. Siding can experience deterioration over time because of prolonged exposure to moisture, temperature changes, wind, sunlight, and other environmental conditions. Cracked, warped, loose, or deteriorated siding can affect the exterior condition of a property and may indicate a need for inspection and replacement.

“Expanding siding installation capacity allows more homeowners throughout Central Ohio to have access to both James Hardie fiber cement siding and vinyl siding as part of their exterior improvement projects,” said Drew Paetow, owner of Best Roofing & Siding Company in Worthington, Ohio. “Each property has different requirements, so the siding material and installation approach need to be evaluated based on the condition of the home and the scope of the project.”

Siding installation can involve more than the removal and replacement of visible exterior panels. Proper installation may require evaluation of the existing siding, preparation of the underlying surface, attention to moisture management, and appropriate installation around windows, doors, corners, rooflines, and other exterior transitions. These factors can affect the finished appearance as well as the performance of the siding system.

For homeowners considering James Hardie siding installation in Central Ohio, fiber cement siding can provide an alternative to traditional exterior materials. James Hardie siding products are available in styles designed to replicate the appearance of wood siding while using a fiber cement composition. The material is used in a variety of residential applications and can be selected according to the design and functional requirements of an individual home.

Vinyl siding remains another option within the expanded siding installation service. Vinyl siding is available in a range of colors, profiles, and textures and is commonly selected for residential siding replacement projects. Its characteristics differ from those of fiber cement, making comparisons between materials useful when determining the appropriate solution for a specific property.

The expanded coverage applies to homeowners across Central Ohio who require siding installation or replacement services. Residential siding projects can vary substantially in size and complexity, from replacement of sections affected by localized damage to comprehensive siding replacement involving the

exterior of an entire home. Evaluating the existing condition of the siding and the structure beneath it can help establish the appropriate scope of work.

Weather exposure is an important consideration for homes throughout Ohio. Seasonal changes can subject exterior siding to fluctuations in temperature, precipitation, wind, and humidity. Over time, these conditions can contribute to fading, cracking, moisture intrusion, or other forms of exterior deterioration, depending on the siding material and condition of the installation.

Siding also intersects with other components of a home's exterior envelope. Roofing, gutters, flashing, windows, doors, and siding must work together to direct water away from the structure and limit unwanted moisture exposure. When siding is replaced, conditions around these adjoining components can therefore become relevant to the overall installation process.

The expansion of siding installation services complements Best Roofing & Siding Company's broader focus on residential exterior work. By increasing capacity for both James Hardie fiber cement siding and vinyl siding projects, the company is positioned to address a wider range of siding replacement and installation requirements across Central Ohio.

The expansion comes as residential property owners continue to evaluate exterior improvements based on the age, condition, appearance, and maintenance requirements of their homes. Siding replacement can be considered when existing materials have reached the end of their useful service life, sustained significant damage, or no longer meet the property owner's exterior requirements. A professional assessment can help determine whether repair, partial replacement, or full siding replacement is appropriate.
