Natura Pest Control Expands Service Offerings in Northern Nevada

August 24, 2026

BOISE, ID - August 24, 2026 -
Natura Pest Control has expanded its range of services for pest control in Reno, NV, adding treatment options that reduce reliance on synthetic chemical applications.

The company said the expansion adds natural repellent treatments, non-toxic application methods and exclusion work intended to keep pests out of structures rather than treating them after entry. Representatives said the additions supplement existing services rather than replacing them, and that treatment selection depends on the pest involved and the conditions at a given property.

Exclusion work accounts for a growing share of the company's requests, according to representatives. They said this involves sealing entry points, correcting conditions that attract pests, and modifying areas where pests establish themselves. The company said exclusion generally requires more time on site than a treatment application but reduces the frequency of return visits.

Representatives said customer questions about product safety have become more common, particularly from households with children or pets. They said consultations now include a review of what is being applied, where it is applied and what precautions apply afterward, and that this discussion happens before work begins rather than at the time of service.

The company said its technicians complete training on treatment methods, application procedures and pest identification. Representatives said identification is a significant part of the work, since treatment approaches differ considerably depending on the species involved and misidentification leads to ineffective applications.

Regional conditions affect what pests are active and when, according to the company. Representatives said northern Nevada's climate produces seasonal patterns that differ from other parts of the country, and that scheduling recommendations account for when particular pests are most active locally.

Property owners considering pest control in Reno, NV should expect an inspection before any treatment

recommendation, according to the company. Representatives said conditions vary between properties, and that recommendations made without an inspection often fail to address the conditions allowing pests to establish.

Alongside the service expansion, the company has published informational material covering common pest issues in the region. Representatives said the material addresses identification, conditions that attract particular pests, and what property owners can expect from professional treatment. They said topics were drawn from questions that come up during service calls.

The company said the material also covers what happens after treatment. According to representatives, questions about follow-up visits, what to expect in the days following an application and when a return visit is warranted account for a substantial portion of customer contact.

Representatives said the company schedules follow-up inspections as part of ongoing service agreements. They said the interval depends on the pest and the property, and that some situations require more frequent monitoring than a standard schedule provides.

Representatives said commercial properties account for a portion of the added capacity. They said businesses in food service and storage face requirements that differ from residential work, including documentation of treatments and scheduling around operating hours, which the company said factored into how the expanded services were structured.

Scheduling has been adjusted alongside the expansion, according to the company. Representatives said technicians are assigned by area rather than dispatched individually across the full service region, which they said was intended to reduce travel time and allow more consistent scheduling during periods of higher demand.

The company said it also reviewed how the added services affect appointment length. Representatives said exclusion work and inspections require longer appointment windows than treatment applications, and that scheduling was restructured so those visits are not compressed into slots sized for shorter work.

The company said it plans to continue evaluating its service offerings as customer requests develop. Representatives said decisions about adding services depend on technician training capacity and scheduling rather than a fixed timeline, and that no additional services have been confirmed.

Additional information about Natura Pest Control and its services is available through the company's website.
