Tawzer Dental Introduces Advanced Digital Dentistry Suite

August 24, 2026

PROVIDENCE, UT - August 24, 2026 -
Tawzer Dental, a dental practice in Logan, Utah, has announced the introduction of its new digital dentistry suite. Dr. Mark L. Tawzer and his team are incorporating digital technologies into the practice to support diagnostics, treatment planning, and the delivery of select dental restorations.

Digital technology has become increasingly common in modern dentistry, with tools designed to provide dental professionals with detailed information and streamlined workflows. Tawzer Dental?s new suite includes 3D imaging and computer-aided design and manufacturing (CAD/CAM) technology, which can be used for certain restorative procedures and treatment planning.

One of the technologies available at the practice is an intraoral scanner. Unlike traditional impression materials, an intraoral scanner captures digital images of the patient?s mouth. The resulting 3D model can provide dentists with digital information that may be used to evaluate oral structures and plan appropriate treatment.

The technology can also be used as part of the process for creating certain dental restorations. CAD/CAM systems allow dental professionals to digitally design restorations such as crowns, inlays, and onlays. Depending on the procedure and individual patient circumstances, this workflow may allow certain restorations to be designed and produced during a single appointment rather than requiring multiple visits.

Dr. Mark L. Tawzer said the addition of the technology reflects the practice?s ongoing focus on incorporating digital tools into dental care.

?Our goal is to stay current with developments in dental technology and determine where these tools can be useful for our patients,? Dr. Tawzer stated. ?The new digital dentistry suite gives our team additional resources for treatment planning and restorative procedures while providing patients with a more streamlined experience in appropriate cases.?

The digital dentistry suite also includes 3D imaging capabilities. Three-dimensional imaging can provide detailed visual information that dentists may use when evaluating a patient?s oral structures and planning certain treatments. The technology is used alongside other diagnostic information and clinical examinations as part of the overall treatment process.

For patients, digital workflows may also reduce the need for certain traditional procedures. For example, intraoral scanning can replace conventional physical impressions in appropriate cases, providing a digital alternative for capturing information about the teeth and surrounding oral structures.

The introduction of the digital dentistry suite is part of Tawzer Dental?s broader efforts to incorporate technology into its services. The practice also provides educational resources covering topics related to oral health, dental procedures, and developments in dentistry.

Patients researching options for a dentist in Logan, Utah can learn more about the practice?s services and digital dentistry options by contacting Tawzer Dental directly. The availability of specific digital procedures depends on the patient?s dental needs and the treatment recommended by the dental team.

For individuals looking for a dentist in Logan, Utah, Tawzer Dental provides information about its dental services and technology through its website. Patients can contact the practice to discuss available treatments and determine whether digital dentistry options may be appropriate for their individual needs.

The practice is located in Logan and serves patients throughout the surrounding Cache Valley area. Individuals interested in learning more about the digital dentistry suite can contact Tawzer Dental to discuss available services, ask questions about digital treatment options, and determine whether these technologies may be appropriate for their individual dental needs. Patients can also contact the practice to learn more about available appointments and schedule a consultation with the dental team.
