

## Algo Trading Space Launches In-House Built Origin Portfolio

*August 27, 2026*

ELIN PELIN, BG - August 27, 2026 -

Algo Trading Space has announced the launch of the Origin Portfolio, the first collection of automated foreign exchange strategies developed entirely by its internal team rather than licensed from outside vendors. The portfolio comprises four Expert Advisors operating across five currency pairs on the MetaTrader platform, and follows a development cycle that ran for more than six months.

Live deployment is scheduled to begin at the start of the coming trading week, once a final validation stage on a demonstration account has been completed. Until now the company has built its published research around Expert Advisors acquired from third-party developers, a practice that founder Petko Aleksandrov said carried a persistent limitation.

"When a robot arrives from an outside vendor, the entry and exit logic stays hidden from the buyer, and that has always been the part which concerned me most once real capital is involved," said Petko Aleksandrov, Founder of Algo Trading Space. "Building this ourselves means every condition inside each strategy is documented, and we can revise it whenever our own testing indicates that we should."

Each component was constructed using Expert Advisor Studio and its grid edition, a toolset released in 2026 that permits developers to layer recovery logic onto a base entry signal. The team deliberately kept the underlying conditions simple. One strategy included in the collection opens positions when the MACD line crosses its zero level upward, with ADX serving as confirmation and Bulls Power governing the close.

Recovery behaviour is capped rather than open-ended, applying a fixed ceiling on how many additional positions any single sequence may open. Aleksandrov noted that entry signals were traded independently before that recovery component was introduced, on the reasoning that a stronger opening condition reduces how often the mechanism needs to be called upon at all.

The company has also confirmed that it will publish the composition of the portfolio, the position sizing applied to each strategy, and its ongoing results from the first day of live operation, rather than withholding that information during an initial track record period. Subscribers will be able to follow the account through a publicly accessible results page.

"Our team argued for waiting until six months of live history existed before saying anything publicly," Aleksandrov said. "We took the opposite route, because something people can observe from day one is more useful to them than a summary presented once the outcome is already known."

Feedback submitted by the subscriber community will be reviewed and may inform revisions to individual strategies. Because the underlying intellectual property sits with the company rather than an external developer, adjustments can be made directly, and anyone holding a current licence will receive subsequent versions as they are issued. Aleksandrov indicated that individual Expert Advisors may be substituted over time should internal research identify a candidate that performs more consistently under the firm's robustness checks, with the wider structure of the portfolio remaining unchanged.

Ahead of live deployment the portfolio is running on a demonstration account with BlackBull Markets, a step applied as standard procedure to confirm that configuration files and platform settings have been implemented correctly before funds are committed. The same validation sequence is used across the firm's other deployments.

Algo Trading Space emphasised that algorithmic trading in foreign exchange markets carries a substantial risk of loss. Approaches that add positions during adverse price movement can increase exposure, and outcomes observed in historical simulation offer no assurance regarding future results. Prospective users should assess their own financial circumstances, and their tolerance for loss, before deploying any automated system.

The company publishes research, product reviews, and educational material covering automated foreign

exchange trading, and reports the performance of the live and demonstration accounts that it operates. Further detail on the construction and testing of the strategies is available from Algo Trading Space.
