

Quality Water Treatment Expands Atmospheric Water Generator Collection for Homes, Businesses, and Disaster Relief

August 26, 2026

Box Elder, South Dakota - August 26, 2026 -

An atmospheric water generator draws moisture from ambient air and converts it into drinking water, offering a water source that does not depend on aquifers, rainfall, or municipal infrastructure. The technology works by pulling air through a filter, cooling it below its dew point with a condenser and refrigerant system, and then filtering the resulting condensate. Quality Water Treatment, a dealer of residential and commercial water treatment equipment, now carries a collection of these systems aimed at homeowners, businesses, and disaster-relief organizations seeking decentralized access to clean drinking water.

The company's atmospheric water generator lineup currently includes three products. The Air to Water H2O Machine and the Altitude Water AWG are positioned for residential and light commercial use, while the Watergen GEN-L Large Scale Air to Water Generator is rated to produce up to 6,000 liters per day for commercial and institutional settings. Each product represents a different scale of the same underlying condensation process.

Atmospheric water generation depends heavily on environmental conditions. Quality Water Treatment notes on its collection page that an AWG generally requires a minimum of roughly 35 percent ambient humidity to produce water, and that output varies according to local humidity levels. Because of this dependency, the company recommends matching each system to the climate and demand of a specific location rather than applying a single recommendation across all buyers.

The systems are also described as compatible with solar or wind power, allowing off-grid operation. That capability makes the technology relevant to emergency management, agriculture and irrigation, and remote or disaster-affected areas where conventional water infrastructure may be unavailable or compromised. An Air to Water Machine deployed in such settings can supplement or replace trucked-in supplies while grid access is restored.

"Atmospheric water generation is best understood as one tool among several, not a universal solution," said a spokesperson for Quality Water Treatment. "The right system depends on local humidity, daily demand, and available power, which is why matching a customer to a specific unit matters more than pointing them toward a general product category."

Quality Water Treatment states that it provides pre- and post-purchase consultation from water treatment specialists, distinguishing its approach from big-box retail by pairing customers with a specific system rather than a one-size-fits-all recommendation. The company also offers a free water analysis and sizing tool on its website to help buyers evaluate their needs before making a decision.

"An atmospheric water generator can offer real independence from municipal supply, but only when it is correctly sized," the spokesperson added. "The goal is to give homeowners, businesses, and relief organizations accurate information about what these systems can and cannot do in their conditions."

Quality Water Treatment is an online retailer of water treatment products, including water softeners, whole-home filters, ozone and iron filtration systems, and atmospheric water generators from a range of manufacturers. The company serves customers on both city water and well water and provides technical support and product guidance from water treatment specialists.
