

Project 2 Payment Highlights Electrical Invoice Software Amid Contractor Shift to Digital Billing

August 31, 2026

ST PAUL PARK, MN - August 31, 2026 -

Project 2 Payment, a software company serving contractors and service professionals, has drawn attention to its electrical invoice software as more electricians and electrical contractors move away from paper-based billing in favor of digital tools that speed up payment collection.

The company reports that electrical contractors face growing pressure to manage detailed billing that accounts for labor, materials, and project milestones while keeping cash flow steady. In response, Project 2 Payment has positioned its platform to address the specific billing challenges electricians encounter on residential and commercial jobs.

The platform allows electrical contractors to create detailed invoices, track payments in real time, and maintain accurate financial records without paperwork. Features include customizable templates, automated reminders, integrated payment options, and tools to track labor, materials, and project milestones. The software joins a broader suite of industry-specific products the company offers for fields such as landscaping,

HVAC, and plumbing.

Jay Bruber, a spokesperson for Project 2 Payment, noted that the demand for streamlined billing reflects wider changes across the trades. "Electrical contractors are spending significant time on paperwork that could be spent on job sites," Bruber said. "The Project 2 Payment electrical invoice software was built to reduce that administrative burden, giving electricians a clear way to bill accurately and collect payments faster."

The company points to several factors driving the shift toward digital billing, including client expectations for professional documentation and the need for faster payment turnaround. Delayed invoicing and manual record keeping can slow cash flow for small and mid-sized electrical businesses, and digital tools aim to close that gap by automating routine steps in the billing cycle.

Beyond invoicing, the platform provides contractors with the ability to create project estimates, collect digital payments, and track projects from start to finish. The company also maintains a business resource center and a blog covering business management, industry trends, and practices relevant to contractors across multiple trades.

Bruber added that the electrical trade presented particular billing complexity that shaped the product. "Electrical work often involves multiple phases, varying material costs, and inspections that affect timing," Bruber said. "Software designed with those realities in mind helps contractors keep their records organized and their invoices accurate from the first estimate to the final payment."

Project 2 Payment noted that its industry-specific approach stems from the recognition that a plumbing job and an electrical installation carry different billing requirements. By tailoring templates and tracking features to each trade, the company aims to reduce the manual adjustments contractors typically make when using general-purpose accounting tools.

Project 2 Payment is a software company based in St Paul Park, Minnesota, that provides a platform for contractors to manage project estimates, invoicing, and digital payment collection. The company serves a range of industries, including cleaning, electrical, handyman, home services, HVAC, landscaping, masonry, painting, and plumbing. Its products are designed to simplify billing and payment workflows for service professionals, supported by a business resource center and educational blog content.
