

Gantry Oral & Maxillofacial Surgery Expands Care for Patients

August 27, 2026

August 27, 2026 -

Gantry Oral & Maxillofacial Surgery has announced an expansion of its services in Long Island City, reflecting continued demand for specialized surgical dental care in the area. As more patients seek oral surgery in Long Island City, the practice is broadening its clinical capabilities to address a wider range of conditions involving the teeth, jaws, and surrounding facial structures. The expansion includes additional treatment options, updated facilities, and educational resources intended to support patients throughout the treatment process.

Founded by oral surgeon Dr. Jonathan Gantry, Gantry Oral & Maxillofacial Surgery provides surgical services for patients with a variety of oral and maxillofacial needs. The practice's team focuses on treatment planning, diagnostic evaluation, and coordinated care for procedures ranging from tooth removal to more complex surgical interventions. The latest expansion represents an effort to respond to changing patient needs while increasing access to specialized procedures within the Long Island City community.

Among the services included in the expansion are dental implant placement, bone grafting procedures, and corrective jaw surgery. These treatments may be recommended for patients experiencing tooth loss, insufficient bone structure, jaw alignment concerns, or other conditions requiring surgical management. By expanding these areas of care, the practice can evaluate and manage a broader range of cases within its Long Island City location.

The practice has also updated portions of its clinical facilities with technology designed to assist with diagnostic imaging, treatment planning, and surgical procedures. Digital tools can provide clinicians with detailed information about a patient's oral structures before treatment begins, helping the surgical team determine an appropriate approach for individual cases.

"Advances in diagnostic and surgical technology continue to change how oral and maxillofacial procedures are planned and performed," a spokesperson for Gantry Oral & Maxillofacial Surgery said. "Our expansion is intended to give patients access to additional treatment options while maintaining a strong focus

on careful evaluation, communication, and individualized treatment planning.?

The practice is also incorporating minimally invasive approaches when clinically appropriate. These techniques are intended to limit unnecessary disruption to surrounding tissues and may support the recovery process following certain procedures. Treatment recommendations depend on each patient's diagnosis, overall health, and the complexity of the procedure being performed.

Alongside the clinical expansion, Gantry Oral & Maxillofacial Surgery has introduced additional educational resources covering common oral health conditions and surgical treatments. Articles and informational materials address topics such as dental implants, bone preservation, jaw surgery, wisdom teeth removal, and recovery after surgical procedures. The resources are designed to help patients better understand why certain treatments may be recommended and what they can expect during different stages of care.

Community education remains another component of the practice's outreach efforts. Gantry Oral & Maxillofacial Surgery participates in local health events and educational programs focused on oral health awareness. These activities provide opportunities for community members to learn more about conditions that may require evaluation by an oral surgeon and the role early diagnosis can play in treatment planning.

The expansion comes as oral and maxillofacial surgeons continue to manage a wide variety of conditions involving impacted teeth, missing teeth, jaw abnormalities, facial injuries, and bone loss. Advances in imaging, surgical techniques, and implant dentistry have also expanded the range of treatment options available for patients who require specialized care.

For Long Island City residents, the availability of additional surgical services locally may reduce the need to travel outside the community for certain procedures. Patients seeking oral surgery in Long Island City can now access an expanded range of diagnostic and surgical services through the practice, including treatments involving dental implants, bone grafting, tooth extraction, and jaw correction.

Gantry Oral & Maxillofacial Surgery stated that the expansion will continue to emphasize patient education and communication before and after treatment. Consultations typically involve an examination, review of medical and dental history, diagnostic imaging when needed, and a discussion of available treatment options. Patients are also provided with information regarding preparation, recovery, and follow-up care associated with their recommended procedure.

The practice expects the expanded services and educational initiatives to support ongoing oral health needs within Long Island City and nearby communities. As developments in oral and maxillofacial surgery continue, the clinic plans to evaluate additional technologies and treatment approaches that may be appropriate for its

patients.

For more information about Gantry Oral & Maxillofacial Surgery and its expanded services, patients may visit the practice's official website or contact its Long Island City office directly. The practice will continue providing information about available procedures, consultation requirements, and developments related to specialized surgical dental care.
