

K L Contractor Plumbing Publishes Recurring Drain Clog Guide

October 08, 2026

MARIETTA, GA - October 08, 2026 -

K L Contractor Plumbing Inc has published new guidance, "Why Does My Drain Keep Clogging After It Has Been Cleaned?", explaining why a drain may become blocked again after a previous cleaning. The resource helps homeowners understand when a recurring blockage may call for further diagnosis instead of another attempt to clear the same line.

A drain can become clogged again for several reasons. Material may continue to collect inside the pipe, the original obstruction may remain partly in place, or the blockage may be farther into the drainage system. Repeated problems can also involve several fixtures that share the same drain line.

The guide explains that recurrence alone does not confirm sewer damage. The pattern of the drainage problem provides more useful information. A drain that works normally for a long period before developing another blockage differs from one that slows or backs up soon after cleaning.

Repeatedly clearing the same drain without understanding why the blockage returns may leave the underlying cause unresolved," said Alex Laldin, marketing director at K L Contractor Plumbing Inc. "The location, frequency, affected fixtures, and history of previous cleaning can help determine what should be checked next."

Kitchen and bathroom drains can develop recurring restrictions from materials associated with normal use. Kitchen lines can collect grease, food debris, and other waste. Bathroom drains often collect hair, soap residue, and similar material. A problem limited to one fixture may involve its immediate drain, while several affected fixtures can point to a shared portion of the drainage system.

How many fixtures are affected is an important diagnostic detail. Several slow drains, simultaneous backups, or water appearing in one fixture when another is used may indicate that the problem extends beyond an individual sink, shower, or toilet. These signs do not prove that an underground sewer line is damaged, but they may warrant a closer assessment of the drainage system.

The new resource further explains the difference between cleaning methods and plumbing repairs. Mechanical snaking can clear many types of obstructions. Hydro jetting can remove certain forms of buildup from inside suitable drain or sewer lines. The correct method depends on the blockage, pipe condition, and findings from the plumber's evaluation.

Cleaning and repair serve different purposes. Hydro jetting can remove buildup when conditions support its use, but it does not repair a damaged pipe. Likewise, repeating a snaking service may restore drainage without correcting a separate condition farther down the system. Identifying the cause helps determine whether cleaning, further inspection, or repair fits the situation.

A sewer-camera inspection may provide more information when the same blockage keeps returning, several drains are affected, or previous cleaning has produced only temporary results. A camera can help examine portions of a drainage line that cannot otherwise be viewed directly. The guide states that an inspection should answer a specific diagnostic need rather than become an automatic part of every drain-cleaning service.

Tree roots and damaged sewer pipes can contribute to recurring drainage problems under some conditions. However, repeated clogs alone do not establish either cause. Similar symptoms can result from ordinary buildup, a localized obstruction, a blockage farther into the system, or another main-line condition. A closer assessment helps distinguish among these possibilities before repair or replacement is considered.

The resource also addresses situations that may require prompt professional attention. Sewage entering the home, severe backups affecting several fixtures, overflowing wastewater, or conditions that threaten property

damage call for a different response than an isolated slow drain. The severity of the current symptoms matters more than recurrence by itself.

Homeowners also contribute useful context during diagnosis. Details such as which fixtures are affected, how often the blockage returns, when the problem started, and how long previous cleaning provided relief can help identify patterns. Information about earlier DIY products or professional cleaning methods can also give the plumber more context.

K L Contractor Plumbing Inc provides drain cleaning, drainage diagnosis, sewer line repair, and other plumbing services for homes and businesses. The company serves Marietta and nearby Metro Atlanta communities and evaluates drainage problems based on the symptoms, system condition, and findings from inspection.
