

Imprint Family Dentistry Adds Dental Bridge Services for Patients

August 28, 2026

August 28, 2026 -

Imprint Family Dentistry has announced the addition of specialized restorative dental services focused on dental bridges in Arcadia, CA. The expansion adds another tooth-replacement option to the practice's existing services and is intended to address the needs of local patients experiencing tooth loss.

Dental bridges are commonly used to replace one or more missing teeth by connecting an artificial tooth to adjacent teeth or dental structures. Depending on a patient's circumstances, bridges may help restore chewing function and contribute to the appearance and alignment of the teeth. Treatment options vary based on oral health, the location of missing teeth, and other individual factors.

The practice said its dental bridge services incorporate current techniques and materials used in restorative dentistry. The treatment process typically begins with an evaluation to determine whether a bridge is an appropriate option. Additional planning may include examining the surrounding teeth and gums and assessing how the proposed restoration will fit within the patient's bite.

Dr. Emily Hartman of Imprint Family Dentistry said the addition reflects the practice's focus on providing patients with information about available restorative options. "Replacing missing teeth involves more than addressing appearance," said Dr. Hartman. "Patients should understand how different restorative treatments can affect function, comfort, and oral health so they can make informed decisions with their dental provider."

Dental bridges can be used in a variety of situations, including the replacement of a single missing tooth or several adjacent teeth. Depending on the type of bridge selected, the restoration may be supported by neighboring teeth or other dental structures. A dental professional can determine which approach is appropriate after reviewing the patient's specific needs.

The practice noted that replacing missing teeth may also help address changes that can occur when gaps remain untreated. Neighboring teeth can shift into open spaces, potentially affecting bite alignment and making oral hygiene more difficult. A bridge may help maintain the spacing between teeth while restoring

some lost dental function.

Post-treatment care is also an important consideration for patients who receive dental bridges. Regular dental examinations and daily oral hygiene can help monitor the condition of the restoration and the surrounding teeth and gums. The appropriate maintenance routine may vary depending on the type of bridge and the patient's overall oral health.

As part of the service expansion, Imprint Family Dentistry has also published educational information about dental bridges. The online resource discusses the general treatment process, potential uses for bridges, considerations patients may want to discuss with a dentist, and maintenance following treatment.

The educational material is intended to give community members a starting point for understanding tooth-replacement options. Patients considering restorative treatment can use consultations with dental professionals to discuss their specific circumstances and compare bridges with other available approaches.

The practice said the new service is part of its ongoing effort to respond to changing patient needs in the Arcadia community. The addition of dental bridges in Arcadia, CA gives patients another option to discuss when evaluating treatment for missing teeth.

Dental bridge treatment is not appropriate for every patient, and factors such as the condition of supporting teeth, gum health, bone structure, and the number and location of missing teeth can influence treatment decisions. A dental examination is generally needed before a provider can determine whether a bridge is suitable.

Imprint Family Dentistry encourages individuals with missing teeth or concerns about changes in their bite to discuss their options with a dental professional. The practice's newly published educational resource provides additional general information for community members researching restorative dental treatments.
