

Marble & Granite Masters, Inc. Expands Countertop Services With Quartz in San Diego

September 04, 2026

September 04, 2026 -

Marble & Granite Masters, Inc. has announced an expansion of its countertop services to include quartz countertops in San Diego, CA, adding another material option for residential and commercial projects throughout the area. The addition reflects changing preferences among homeowners and designers who are considering surfaces that balance appearance, durability, and everyday maintenance requirements.

Founded more than two decades ago, Marble & Granite Masters, Inc. has provided stone products for residential and commercial applications. Its existing material selection includes marble and granite, and the addition of quartz broadens the range of surfaces available to customers planning kitchen, bathroom, and other countertop projects.

Quartz has become a widely considered countertop material because of several practical characteristics. Engineered quartz surfaces are nonporous, which can make routine cleaning and maintenance more straightforward. The material is also known for resistance to stains and scratches under normal use. In addition, quartz is manufactured in a broad selection of colors and patterns, giving property owners and designers flexibility when coordinating countertops with cabinets, flooring, fixtures, and other interior finishes.

“Homeowners and designers are increasingly interested in materials that combine aesthetic appeal with practical benefits,” a spokesperson for Marble & Granite Masters, Inc. said. “Quartz provides an ideal solution with its unique combination of beauty and durability, and we are thrilled to bring these benefits to our clients in San Diego, CA.”

The expansion comes as consumers continue to consider long-term maintenance when selecting materials for kitchens and bathrooms. Countertops are frequently exposed to spills, food preparation, moisture, cleaning products, and routine household activity. As a result, factors such as durability, surface care, appearance, and suitability for the intended space can influence the material-selection process.

Quartz differs from natural stone because it is an engineered material rather than a slab quarried directly from

the earth. Its manufacturing process allows for consistency across colors and patterns while providing consumers with a variety of design choices. These characteristics can make quartz suitable for projects where a specific or coordinated appearance is desired.

The company's addition of quartz also gives customers an alternative to its existing marble and granite offerings. Each countertop material has distinct characteristics, making the selection process dependent on factors such as the intended application, desired appearance, maintenance preferences, and overall project design. Providing multiple material choices allows property owners and design professionals to compare those characteristics before determining which surface fits a particular project.

Marble & Granite Masters, Inc. has also published information on its website discussing quartz and its potential benefits for countertop applications. Educational resources can help homeowners better understand differences among countertop materials before making decisions about renovations or new installations. Evaluating factors such as maintenance, durability, color, pattern, and how a surface will be used can be an important part of planning a kitchen or bathroom project.

Sustainability has also become part of broader conversations surrounding building and remodeling materials. Some engineered quartz products may incorporate recycled materials, while the durability and expected service life of countertop surfaces can also factor into decisions about material use and replacement. Specific environmental characteristics can vary depending on the quartz product and manufacturer, making individual product information important when sustainability is a project consideration.

For Marble & Granite Masters, Inc., the addition of quartz complements its established work with marble and granite. The expanded selection is intended to address a wider variety of design preferences and functional requirements while maintaining the company's focus on stone fabrication and countertop installation.

The availability of quartz countertops in San Diego, CA gives local homeowners, designers, and commercial clients another option when evaluating surfaces for new construction and remodeling projects. Customers can consider quartz alongside marble and granite based on the needs of the space, the desired visual result, and the level of ongoing maintenance they prefer.

Marble & Granite Masters, Inc. serves residential and commercial clients in Southern California and provides countertop materials for a range of interior applications. With quartz now included among its available options, the company is expanding its material selection in response to evolving countertop preferences and the continued demand for surfaces that combine practical performance with varied design

possibilities.
