Bumper Specialties Highlights Polyurethane Bumper Solutions for Electronics and Appliance Applications

September 09, 2026

WEST DEPTFORD, NJ - September 09, 2026 -
Bumper Specialties, Inc., a global manufacturer of self-adhesive polyurethane rubber bumper feet, has outlined how its molded bumper products address common stability and surface protection needs within electronics and appliance applications. The company points to growing demand across these sectors for components that keep devices steady while preventing damage to the surfaces beneath them.

Self-adhesive polyurethane bumpers serve as small but functional components in a broad range of products, from consumer electronics and kitchen appliances to industrial equipment. When applied to the base of a device, the bumpers add grip, reduce sliding, and create a protective barrier between the product and the surface on which it rests. Manufacturers in these industries frequently rely on such components to reduce vibration, dampen noise, and guard against scratches.

The polyurethane bumpers produced by Bumper Specialties are crack-resistant, non-skid, and manufactured without plasticizers, oils, or fillers. Because of this composition, the bumpers do not mar, scratch, or stain the surfaces they contact, a characteristic that holds particular relevance for appliance and electronics makers concerned with both product performance and the finished surfaces in a customer's home or workspace.

The company manufactures more than 40 different shapes of polyurethane rubber feet in clear, black, white, brown, and gray. Beyond its standard catalog, the company also provides custom bumper design, including custom shapes and colors, special die-cut sheets, and customizable packaging intended to match the specifications required for particular applications. Engineering support accompanies these services, allowing product designers to develop a bumper suited to a specific use case.

"Electronics and appliance manufacturers need components that perform quietly in the background, keeping products stable and protecting surfaces without drawing attention to themselves," said Bob Romanelli, spokesperson for Bumper Specialties. "The material and shape of a bumper make a meaningful difference in how a finished product behaves, and that is where careful design and engineering support come into play."

Production takes place in a 100,000 square foot manufacturing facility with the capacity to produce millions of bumper feet each day. The company maintains a large inventory to support the varied order volumes that arise across different industries and applications.

"Every application carries its own requirements, whether that involves a particular color, a specific shape, or a defined level of grip," Romanelli added. "Working directly with manufacturers to match those requirements is central to how the company approaches each project."

Bumper Specialties ships to more than 70 countries, working with freight forwarders positioned in key locations around the world to move orders efficiently. A multilingual sales team coordinates with international customers throughout the ordering process.

Bumper Specialties, Inc. is a global manufacturer of self-adhesive polyurethane rubber bumper feet based in the USA. The company offers products in a variety of shapes, sizes, and colors used in thousands of applications, and supplements its manufacturing with custom design services, engineering support, and international shipping.
