

Quartate Launches AI Automation Studio With Written Acceptance Tests

September 09, 2026

September 09, 2026 -
Quartate has launched an AI automation studio serving businesses worldwide through a five-business-day proof week on September 1, 2026. Founded by Farhan Ahmed Khan, the studio builds custom AI agents for manual business processes, beginning with one job evaluated against a written acceptance test agreed with the client before payment.

The launch introduces a defined sequence for commissioning automation: identify a business outcome, specify what a successful first implementation must do, assess that implementation using the client's own accounts and data, then agree the scope and fixed price of any further build. The initial implementation and the complete solution are separate stages of the engagement.

During the proof week, Quartate develops one working piece of the client's solution. The scope covers a single job from beginning to end, such as reading one document type and placing the extracted information where it belongs, or checking one month of completed jobs against the relevant contracts. These illustrate the available scope; they are not reported customer deployments or performance results.

"Most business owners hesitate to adopt AI because scoping feels open-ended and the deliverables are vague," said Farhan Ahmed Khan, founder of Quartate. "By tying the initial proof week to a single, pass-or-fail acceptance test written in plain English, we eliminate the guesswork. Clients see concrete proof of value inside their existing systems before committing to a larger build."

Quartate's implementation approach assigns different roles to AI, rules and people. AI reads information and proposes actions. Defined rules check those proposals against the business's records. A person approves actions that cannot be undone. The studio's areas of work include quote and order processing, invoice matching, accounts receivable follow-up, document data extraction and data integration.

For invoice matching, the relevant records include orders and deliveries. Other assignments described by the company include recording enquiries alongside customer histories, preparing quotes from the appropriate price list and assembling weekly reports. The business records used and the required result depend on the particular job selected for the engagement.

Clients receive written handover documentation and a recorded walkthrough, allowing their own teams to operate the automation. They can take over the work or arrange optional monthly maintenance. Maintenance is priced at US$500 to US$2,500 per month, with no minimum term or notice period, so receiving the implementation does not require an ongoing maintenance engagement.

An engagement begins with a free 20-minute call that produces a written plan and an indicative price range. The prospective client keeps the plan whether or not a build follows. The standard proof-week fee is US$1,000, credited in full against a subsequent build or refunded on request. Standard builds are scoped within US$4,000 to US$20,000, with the exact fixed price provided in writing before work begins.

According to Quartate's founder biography, Khan spent six years at a US-based data platform company building and shipping products for enterprise clients worldwide, with the last three years focused on building with AI.

Quartate applies the same pricing regardless of the client's location. Businesses can review the founding-client programme, which offers three places at half price on the first build. Enquiries about an introductory consultation can be directed to Farhan Ahmed Khan, founder, at farhan@quartate.com.

Quartate is an AI automation studio operating globally on a remote-first delivery model. The firm engineers custom AI agents integrated directly into client software stacks, combining generative processing with rule-based system verification and mandatory human checkpoints for high-stakes operational workflows.
