

Mitchem Dental Introduces Advanced Full-Arch Implant Treatment

September 10, 2026

September 10, 2026 -

Mitchem Dental has announced the introduction of an advanced full-arch dental implant treatment designed to address significant tooth loss among patients in Champaign and surrounding communities. The practice's new offering uses the All-On-Four technique, a restorative approach that can support a full-arch prosthesis with four strategically positioned dental implants.

The announcement reflects continued developments in restorative dentistry as dental practices adopt technologies intended to improve treatment planning, implant placement, and patient outcomes. Mitchem Dental is making the procedure available to patients seeking alternatives for extensive tooth replacement, including individuals who may have previously faced limitations related to bone density or the condition of their remaining teeth.

The All-On-Four approach differs from conventional implant treatment by using four implants to provide support for a complete dental arch. The implants are positioned according to the patient's individual anatomy, allowing the prosthetic teeth to be secured to a stable foundation. In appropriate cases, the technique may reduce the number of implants required compared with other full-arch restoration approaches.

Dr. James Mitchem, a dental surgeon at Mitchem Dental, said the treatment represents an important development for patients dealing with extensive tooth loss. The procedure can provide functional and aesthetic restoration while incorporating digital imaging and diagnostic information into the planning process. Individual treatment recommendations remain dependent on factors such as oral health, bone structure, medical history, and overall treatment goals.

Mitchem Dental uses advanced imaging and diagnostic technologies to assist with treatment planning and implant placement. These tools allow dental professionals to evaluate oral structures before treatment and develop a plan based on each patient's anatomy. The practice also continues to incorporate updated clinical techniques and research into its restorative services.

The introduction of All-On-Four treatment comes as the need for comprehensive tooth-replacement options continues to receive attention across the dental industry. Tooth loss can affect more than appearance, potentially influencing chewing ability, speech, nutrition, and everyday social interactions. For patients who have lost most or all of their teeth, full-arch restoration can provide an alternative to conventional removable dentures.

For residents researching All On Floor dental implants in Champaign, IL, the availability of an All-On-Four treatment option provides another approach to consider when discussing extensive tooth replacement with a dental professional. A consultation can help determine whether a patient has sufficient bone structure and overall oral health for implant-supported restoration or whether additional treatment may be appropriate before implants are placed.

Mitchem Dental also emphasizes patient education as part of its approach to restorative care. Information about implant procedures, treatment planning, expected recovery, maintenance, and alternatives can help patients make informed decisions about their oral health. Educational discussions may also address the differences between fixed implant-supported restorations and removable dental prostheses.

Because the needs of each patient are unique, experienced dentists work to find the ideal solution for each case. As dental implant technology continues to develop, treatment options such as All-On-Four are becoming part of broader conversations about restoring oral function after extensive tooth loss. The approach is not appropriate for every patient, making professional evaluation an important part of the process.

Individuals researching All On Floor dental implants in Champaign, IL can contact Mitchem Dental to discuss their circumstances and learn more about available restorative options. The practice's latest service expands the range of implant-based treatments available to patients in Champaign while reflecting ongoing advances in full-arch dental restoration.
