

Sugar Hill Smiles Expands Dental Crown Services for Patients

September 17, 2026

September 17, 2026 -

Sugar Hill Smiles has announced the expansion of its restorative dentistry services with updated options for patients seeking a dental crown in Marion, NC. The practice has incorporated new technology and treatment protocols intended to support the evaluation, preparation, and placement of dental crowns for patients with damaged, weakened, or heavily restored teeth.

Dr. Emily Watson, principal dentist and founder of Sugar Hill Smiles, said the service update reflects changes in both dental technology and patient needs. The practice has served Marion residents with preventive, restorative, and general dental care and is now placing additional emphasis on crown procedures as part of its restorative treatment offerings.

Dental crowns are commonly used to cover and protect teeth that have experienced significant decay, fractures, large fillings, or other structural concerns. They may also be recommended following certain restorative procedures when additional support is needed. The expanded service is intended to provide patients with additional options for restoring tooth function while maintaining a natural appearance.

As part of the update, Sugar Hill Smiles has incorporated digital imaging and newer diagnostic tools into the crown treatment process. These systems can assist dental professionals in evaluating tooth structure, planning treatment, and developing restorations designed to fit a patient's individual dental anatomy.

"We have seen continued interest from patients who want to better understand their restorative options when a tooth has been damaged or weakened," said Dr. Watson. "The goal of this service update is to give patients clear information about the crown process and use current technology to support treatment planning and follow-up care."

The practice has also reviewed the materials used for dental restorations as part of the service expansion. Modern crown materials are available in several forms, and the appropriate selection can depend on the location of the tooth, the condition of the remaining tooth structure, bite forces, and other clinical

considerations.

The announcement also addresses questions patients frequently raise about crown treatment, including how crowns are fitted, what happens during treatment, and how restorations should be maintained after placement. Sugar Hill Smiles has added educational information to its patient resources to explain the role crowns can play in restorative dentistry and the factors dentists consider when recommending treatment.

The expansion comes as dental practices continue to adopt digital tools for diagnosis, restorative planning, and patient education. Advances in imaging and dental materials have changed how crown procedures are planned and completed, giving dental teams additional ways to assess individual cases and discuss potential treatment approaches with patients.

Sugar Hill Smiles stated that the updated service is also part of a broader effort to encourage patients to address damaged teeth before additional deterioration occurs. Cracks, decay, worn restorations, and other structural problems can require different forms of treatment depending on their severity, making professional evaluation an important part of determining whether a crown or another restorative option is appropriate.

The practice is continuing to provide preventive dental care alongside restorative services. According to Sugar Hill Smiles, routine examinations can help identify changes in teeth and existing restorations before symptoms become more noticeable. Patients who have concerns about damaged or weakened teeth can discuss available treatment options during an evaluation.

Patient education will remain part of the expanded crown program. The practice has updated informational materials covering crown placement, oral hygiene, follow-up care, and factors that may affect the longevity of a restoration. The resources are intended to help patients understand what may be involved before, during, and after treatment.

Sugar Hill Smiles also plans to continue reviewing developments in restorative dentistry as new materials and treatment technologies become available. The practice said that updates will be considered based on their clinical applications and relevance to patient care rather than as replacements for individualized diagnosis and treatment planning.

The expanded services represent a new phase in the practice's restorative dentistry program and provide another option for local residents who may need treatment for compromised teeth. Each case is evaluated individually to determine whether crown placement or another form of restorative care may be appropriate.

Residents seeking information about a dental crown in Marion, NC can contact Sugar Hill Smiles or review the practice's updated educational resources. The practice will continue providing information about restorative treatment options as part of its ongoing patient education efforts in the Marion community.
