

Stevens Dental Expands Invisalign Services for Patients

September 17, 2026

September 17, 2026 -

Stevens Dental, a dental practice serving Baton Rouge, Louisiana, has announced the expansion of its orthodontic services with the addition of Invisalign treatment. The development gives local patients another option for addressing tooth alignment concerns without relying on traditional metal braces. Invisalign uses a series of removable, clear aligners designed to gradually reposition teeth throughout a prescribed course of treatment.

The addition of Invisalign in Baton Rouge, LA reflects the practice's effort to respond to changes in patient preferences and the continued development of orthodontic treatment options. Clear aligner therapy has become an increasingly familiar alternative for teens and adults who may prefer a less noticeable orthodontic appliance and the ability to remove aligners during meals and routine oral hygiene.

Dr. Richard Stevens and the Stevens Dental team will oversee treatment planning and patient monitoring throughout the Invisalign process. Patients considering clear aligners generally begin with an evaluation to determine whether Invisalign is appropriate for their specific orthodontic needs. Treatment plans may differ based on the complexity of tooth movement, individual dental conditions, and other factors identified during an examination.

"Invisalign gives us another way to develop treatment plans around the individual needs of each patient," said Dr. Stevens, a spokesperson for Stevens Dental. "The goal is to help patients understand their options, what the treatment process involves, and what will be expected of them throughout care."

Invisalign treatment involves a sequence of customized aligners that are worn for designated periods before being replaced with the next set in the series. The aligners are designed to apply controlled pressure to gradually move teeth toward planned positions. Because the trays can be removed, patients are able to take them out while eating, brushing, and flossing.

The removable design also means that patients are responsible for following prescribed wear schedules.

Consistent use is an important part of the treatment process, and regular dental appointments allow the provider to monitor progress and make adjustments when necessary. Treatment length varies depending on a patient's individual circumstances and the extent of orthodontic correction required.

As part of the service expansion, Stevens Dental has also published educational information on its website addressing the Invisalign process. The resource discusses what patients may experience during treatment, general treatment timelines, and considerations for cleaning and maintaining clear aligners. The practice developed the information to help patients better understand the treatment before deciding whether to pursue an orthodontic consultation.

The expansion comes as clear aligner therapy continues to influence how orthodontic treatment is delivered. Some patients are seeking options that fit more easily into school, work, and social routines, particularly when compared with fixed orthodontic appliances. Clear aligners may address those preferences for qualifying patients while still requiring professional evaluation, treatment planning, and ongoing monitoring.

Stevens Dental noted that Invisalign is not appropriate for every orthodontic situation. Factors such as the type and severity of tooth movement required, existing dental conditions, and patient compliance can affect whether clear aligner treatment is recommended. Patients are evaluated individually before a treatment plan is established.

The practice said the addition is intended to broaden the range of orthodontic services available to residents while incorporating another established treatment method into its existing dental care offerings. The team will continue to provide information about treatment expectations, oral hygiene, aligner use, and follow-up care as part of the process.

For patients interested in Invisalign in Baton Rouge, LA, Stevens Dental is providing additional information through its website and office. Prospective patients may contact the practice to learn more about consultations, treatment requirements, and whether clear aligner therapy may be suitable for their dental needs.
