Tandem Paving Co Inc Brings Sustainability to Asphalt Companies

September 17, 2026

BLUE SPRINGS, MO - September 17, 2026 -
Tandem Paving Co Inc. has announced the introduction of eco-friendly asphalt paving solutions designed to support more sustainable construction practices in the Independence, MO, area. The new initiative expands the company?s existing paving services while responding to growing interest in construction methods that incorporate recycled materials and reduce the use of new resources.

The addition of these environmentally conscious paving options represents a new development for Tandem Paving Co Inc., which has provided paving services in the community for more than two decades. The company?s approach incorporates reclaimed asphalt pavement (RAP) and other recyclable materials into asphalt mixes where appropriate, offering an alternative to paving processes that rely solely on newly produced materials.

Sustainable construction practices have become an increasingly important consideration across the paving industry. Asphalt is already a highly recyclable paving material, and the use of reclaimed asphalt pavement can help reduce the need for virgin aggregate and asphalt binder in certain applications. For asphalt companies in Independence, MO, incorporating recycled materials can provide another option for addressing project requirements while considering material use and environmental impact.

Tandem Paving Co Inc.?s new solutions are intended to maintain the performance characteristics required for paving applications while incorporating recycled content into appropriate asphalt mixes. The company has invested in equipment and processes that support the use of reclaimed materials, with the goal of balancing material efficiency with the durability and performance expected from completed paving projects.

The company?s announcement also reflects an ongoing shift in how property owners, contractors, and other stakeholders evaluate paving projects. Alongside factors such as durability, maintenance requirements, and project specifications, material sourcing and environmental considerations can play a role in determining which paving methods are appropriate for a particular project.

A spokesperson for Tandem Paving Co Inc. said the new initiative reflects the company?s continued focus on adapting its services to changing industry practices. By adding eco-friendly asphalt options to its paving services, the company aims to provide customers with additional choices when planning projects that include sustainability considerations.

In conjunction with the announcement, Tandem Paving Co Inc. is also expanding its educational resources with information about sustainable asphalt paving. The online resource is intended to provide customers and industry professionals with an overview of recycled asphalt materials, their applications, and some of the considerations involved in selecting an environmentally conscious paving solution.

The resource addresses topics related to the production and use of eco-friendly asphalt, including the role of reclaimed asphalt pavement in paving projects. It also provides general information about how recycled materials can be incorporated into asphalt mixes and why material selection can be an important consideration during the planning process.

The educational initiative is intended to give property owners and other project stakeholders more information when evaluating paving options. Rather than treating sustainability as a separate consideration, the resource explains how recycled materials can be incorporated into paving practices alongside traditional project requirements such as performance, application, and maintenance.

For Tandem Paving Co Inc., the introduction of these solutions builds on its longstanding presence in the local paving industry. The company has provided asphalt paving, repair, and maintenance services in the Independence area for more than 20 years, serving projects with a range of paving needs.

The company?s experience includes work involving asphalt installation as well as ongoing repair and maintenance. These services remain part of its broader paving operations as the company adds new options for projects where the use of recycled materials is appropriate.

The announcement comes as sustainability continues to influence construction practices across multiple sectors. For asphalt companies in Independence, MO, the ability to incorporate reclaimed materials can provide another approach to managing material use while meeting the specifications of individual paving projects.

Tandem Paving Co Inc. plans to continue offering information about its eco-friendly asphalt solutions through its website and other customer resources. The company?s latest initiative provides property owners and other stakeholders with an additional paving option while highlighting the role recycled materials can play in modern asphalt construction.

The introduction of these solutions marks another development in Tandem Paving Co Inc.?s ongoing services in Independence, MO. By incorporating recycled materials into appropriate asphalt applications and providing educational information about sustainable paving practices, the company is expanding its approach to asphalt construction while continuing its established paving and maintenance operations.
