Natura Pest Control Expands IPM-Based Service in Reno

September 21, 2026

BOISE, ID - September 21, 2026 -
Natura Pest Control has expanded its residential and commercial service offering in the Reno area, structured around integrated pest management rather than scheduled perimeter spraying.

Integrated pest management is a specific methodology, not a marketing term. It begins with inspection and identification, because treatment for a pest that has been misidentified rarely works. It moves to exclusion and habitat modification, which means sealing entry points, correcting moisture problems, and removing harborage and food sources. Monitoring follows, with treatment applied where an inspection indicates it is warranted and at the point where it will be effective. Product application is part of the approach, not a substitute for it.

That last point is worth stating directly, because it is frequently blurred. IPM does not mean pesticide-free. It means products are selected and placed based on what the inspection found rather than applied on a fixed calendar regardless of conditions. All pesticides, including those derived from botanical sources, are regulated by the EPA and must be applied according to their labels. Natura Pest Control makes no blanket safety claim about any product it uses, and encourages customers to ask what is being applied, where, and what the label says about reentry intervals and precautions around children and pets.

Reno's pest pressure follows the region's climate closely. The high desert produces a distinct seasonal cycle. Ants move indoors in spring and again during late summer heat, seeking water more often than food. Spiders, including black widows, establish in garages, woodpiles, and crawl spaces. Wasps and yellowjackets peak in late summer and become aggressive around food and garbage into early fall. Rodents are the most consistent winter problem, with mice entering through gaps a quarter inch wide as temperatures drop. Properties near the Truckee River corridor or with irrigated landscaping see different pressure than those on drier lots, which is why inspection precedes any treatment plan.

Exclusion work tends to deliver more durable results than treatment alone for rodents, and it is the part customers most often skip because it costs more upfront. Sealing utility penetrations, repairing door sweeps,

screening vents, and addressing gaps at the roofline eliminates the pathway rather than the individual animal. Anyone comparing pest control services in Reno, NV should ask whether a quoted plan includes exclusion or only trapping and baiting, since the two produce very different outcomes over a winter.

Commercial work covers hospitality, healthcare, and food service, where documentation requirements are often stricter than the treatment itself. Facilities subject to health inspection or third-party audit need service records, monitoring logs, and a written program, and those obligations should be confirmed against the specific standard a facility is audited under.

The company publishes prevention guidance covering early signs of infestation, moisture management, and the exclusion steps property owners can handle themselves. Reducing standing water, storing firewood away from the structure, keeping vegetation trimmed back from walls, and sealing food in hard containers all lower pressure before anything needs to be treated.

Property owners evaluating pest control services in Reno, NV are advised to confirm that any provider holds a current Nevada Department of Agriculture applicator license, to ask for the specific products proposed and their labels, and to request a written scope rather than a verbal one.

Service details, coverage areas, and inspection scheduling are available through the Natura Pest Control website.
