

Mogo Wheelchairs Announces New Adaptation Features for Mobility Users

September 22, 2026

September 22, 2026 -

Mogo Wheelchairs has announced a new set of adaptation features intended to provide wheelchair users with additional options for adjusting and operating their mobility equipment. The update includes changes related to control systems, handling, ergonomic adjustments, and digital connectivity as the company continues development of its wheelchair products.

The newly announced features are designed to provide additional flexibility in everyday mobility. The product updates include adjustable components intended to support individual positioning preferences, along with changes to handling and control functions. These adaptations form part of the company's ongoing development of its wheelchair product range.

Among the additions is an updated control system intended to provide responsive operation across different environments. The company has also incorporated smart sensor technology into select features, providing additional equipment-related information during use. The specific functions available may vary depending on the wheelchair model and configuration.

The development of these features reflects continued attention to customisation within mobility equipment. Wheelchair users can have different requirements based on their daily routines, environments, positioning needs, and preferred methods of operation. By offering additional configuration options, Mogo Wheelchairs is expanding the range of adjustments available within its product lineup.

The company has also highlighted ergonomic considerations as part of the latest updates. Adjustable features can accommodate differences in user positioning and operating preferences, while changes to handling characteristics are intended to support manoeuvrability in a range of settings. These considerations are relevant for mobility equipment used across both indoor and outdoor environments.

Digital connectivity is another component of the announced development. The integration of connected technology provides opportunities for mobility equipment to collect and communicate certain information.

Depending on the product configuration, these capabilities may support access to equipment-related information without changing the primary purpose of the wheelchair as a mobility device.

The latest product development also includes changes to how certain wheelchair functions can be adjusted and configured. These options are intended to give users and carers greater flexibility when considering equipment based on individual mobility requirements. Availability of particular adjustments will depend on the applicable model and configuration.

The announcement covers several areas of wheelchair design, including controls, handling, ergonomics, and connected features. Each area can affect how mobility equipment is configured and operated in different settings. Bringing these elements together provides additional options for individuals evaluating wheelchair equipment for specific mobility needs.

Mogo Wheelchairs has also outlined continued attention to product development as part of its work in the mobility equipment sector. The company is focusing its latest announcement on practical equipment features rather than a single application or user group. This approach allows the new adaptations to address multiple aspects of wheelchair configuration and operation.

The latest announcement provides an opportunity for prospective users, carers, and mobility professionals to review the available features when considering wheelchair options. Factors such as control preferences, positioning requirements, manoeuvrability, and available technology can all be considered when determining whether a particular configuration is appropriate.

The newly announced adaptation features are intended to provide additional flexibility for individuals evaluating mobility equipment based on their personal requirements. Features such as adjustable controls, ergonomic components, handling improvements, and connected technology can each play a role in how a wheelchair is configured and used. Availability and specifications will depend on the applicable model.

The announcement represents another stage in Mogo Wheelchairs' ongoing development of mobility products. By addressing several areas of wheelchair design, the company is expanding the range of features available within its product offerings. Further information about individual models and configurations can help users determine which features are available for their specific requirements.

Additional information about the newly announced features, product specifications, and available configurations can be obtained directly from Mogo Wheelchairs through its official communication channels.
