

Sears Fence Details Vendor Partnerships and Safety Standards

September 22, 2026

September 22, 2026 -

Sears Fence recently announced an update regarding its material sourcing partnerships and standardized installation protocols for residential and commercial enclosure projects. As property owners continue to evaluate their perimeter security and landscape needs, the company aims to provide clear information on its operational procedures. Finding suitable options among fence contractors in Raleigh, NC, often involves understanding a company's supply chain and safety standards. This announcement details the specific manufacturers and safety checks that define the daily operations of Sears Fence. By outlining these partnerships, the organization seeks to maintain transparency regarding the materials utilized in everyday installations. The current operational update emphasizes the role of established supplier relationships and standardized safety practices in completing physical property boundaries.

With over 20 years of experience in the construction and perimeter enclosure industry, Sears Fence has developed a systematic approach to project management and site preparation. Over two decades of continuous operation provides the company with historical data on material durability and installation techniques. This background informs the methodologies applied to every project, from initial site evaluation to final post setting. The organization handles a variety of property types, adapting to different terrain requirements found throughout the region. When property owners research fence contractors in Raleigh, NC, they often look for established histories that indicate a consistent approach to the trade. The accumulated experience of Sears Fence allows the teams to navigate common challenges such as uneven ground and complex property line configurations. This extensive background serves as the foundation for the company's current service offerings and vendor selections.

A major component of this recent operational update involves the confirmation of ongoing relationships with multiple material manufacturers. Sears Fence works with Southern Vinyl Manufacturing to source synthetic materials that offer specific weathering properties. Additionally, the company works with Antebellum Manufacturing, expanding the available inventory for custom enclosure designs. To secure durable metal components, the organization works with Stevens Pipe and Steel, ensuring that the structural framework of the installations meets necessary physical requirements. Furthermore, the company works with Elite Fence to

supplement its supply chain with additional enclosure products. Utilizing multiple suppliers allows the teams to source appropriate materials for varied property requirements. This diversified supply chain minimizes project delays related to material shortages and provides property owners with a broader selection of physical boundary options.

In addition to standard material suppliers, Sears Fence maintains specialized credentials to install specific proprietary systems. The company works with Perimtec and holds the designation of Certified Perimtec Installers. This certification indicates that the installation personnel have undergone specific training to handle and assemble Perimtec's unique architectural enclosure products. These specialized systems often feature modern designs and alternative material compositions that require exact installation techniques. By maintaining this certified status, the company ensures that it can offer these products while adhering to strict manufacturer guidelines. Providing specialized options allows the company to address the requirements of contemporary architectural designs and specific commercial security applications. The inclusion of these certified services represents an ongoing effort to adapt to changing technical advancements within the exterior construction sector.

Prioritizing site safety and regulatory compliance remains a central focus of the company's daily field operations. Before commencing any excavation or post installation, Sears Fence contacts 811 to locate underground utilities. This mandatory safety protocol prevents accidental damage to buried water, gas, electrical, and telecommunication lines. Engaging the public utility location service ensures that the installation teams have a clear map of subterranean infrastructure before any digging equipment is utilized on the property. Adhering to this underground utility verification process protects both the property owner and the surrounding neighborhood from unexpected service interruptions or hazardous situations. The systematic implementation of this safety check demonstrates a commitment to responsible construction practices and minimizes the liability associated with blind excavation.

To finalize its operational commitments, the company implements a standardized workmanship guarantee for its completed projects. Sears Fence provides a one-year warranty on fence installations, covering the physical labor and structural integrity of the erected boundaries. This warranty period allows property owners to observe the installation through a full cycle of seasonal weather changes, ensuring posts remain secure. Offering a formal installation warranty establishes a clear protocol for addressing potential settling that may occur after the initial construction phase. This guarantee applies to the labor provided by the teams, complementing the separate manufacturer warranties covering the physical materials. The announcement of these combined operational standards, safety protocols, and vendor partnerships clarifies the structured approach utilized by the organization for exterior enclosure projects.
