Parshall Pest Control Experts Outlines Inspection-led Pest Management Approach For Traverse City Properties

September 23, 2026

September 23, 2026 -
Parshall Pest Control Experts has outlined its inspection-led approach to pest management for homes and commercial properties in Traverse City and surrounding Grand Traverse County communities. The company provides mosquito, tick, mole, and vole control, biting-pest plans, insect-protection plans, and broader home-protection services.

Parshall Pest Control Experts approach begins with inspecting a property to identify the pest, determine the extent of activity, and evaluate conditions that may contribute to the problem. These can include openings around foundations, doors, windows, utility penetrations and garages, as well as access to food, moisture and shelter.

This sequence is consistent with integrated pest management principles described by the U.S. Environmental Protection Agency. The EPA defines integrated pest management, commonly called IPM, as an

environmentally sensitive approach that combines information about pests with available control methods. Its framework emphasizes monitoring and identification, prevention, action thresholds, and selection of appropriate controls based on effectiveness and risk.

Correct identification matters because organisms found around a building do not necessarily present the same risks or require the same response. EPA guidance states that inspection and monitoring help determine whether action is necessary, identify vulnerable areas, and reduce the possibility of using an unnecessary or unsuitable pesticide.

?An inspection gives the technician and property owner a factual starting point,? said Corey Parshall, owner of Parshall Pest Control Experts. ?The objective is to identify the pest, understand why it is present, and determine which preventive or control measures are appropriate for that specific property. Treatment should follow the evidence collected during the inspection rather than a general assumption.?

Preventive measures may include sanitation, moisture correction, vegetation management, and sealing openings through which pests enter. EPA building guidance lists weatherization, pest barriers, removal of standing water, and elimination of food, water, and shelter as components of prevention. When monitoring indicates that additional control is necessary, IPM favors targeted, lower-risk methods before broader applications.

Parshall Pest Control Experts states that its technicians evaluate exterior foundations, windows, doors, and garage areas for holes or cracks that could provide access to insects or rodents. The company also explains its findings to property owners before beginning the selected service.

Customer feedback can provide context about how residents experience that process, although an individual review does not establish results for every property. A attributed Caitlin White Google review states: ?Highly recommend this company and highly recommend Brady! Brady is thorough at his job. Educates you when you have questions or concerns. He?s top notch at what he does. He actually cares about his work and the job at hand. 100000000/10 parshall pest control and Brady!?

The educational component described in the review reflects a practical part of pest management: occupants influence the conditions that attract or exclude pests. EPA guidance recommends informing building occupants about prevention and documenting inspection findings, monitoring results, and control actions so that a pest-management plan can be evaluated and adjusted over time.

Parshall?s services address outdoor biting pests as well as structural and invader problems. The appropriate response depends on the organism, the property, and the observed level of activity. A mosquito issue involving standing water, for example, requires a different assessment from rodents entering around utility

lines or insects overwintering in wall voids.

The company?s September announcement establishes the base of a three-part public-information series. Subsequent releases will examine integrated home protection and fall preparation for rodents and overwintering insects. The series is intended to provide Traverse City homeowners and industry professionals with source-based information about inspection, prevention, and seasonally appropriate pest management.

Parshall Pest Control Experts provides pest-management services for residential and commercial properties in the Traverse City area. Its listed services include mosquito and tick control, mole and vole control, biting-pest plans, insect-protection plans, and complete home protection. Read more at https://parshallpestcontrol.com.
