

Guardian Recovery - Princeton Detox & Recovery Center Launches New Residential Inpatient Program

September 29, 2026

MONMOUTH JUNCTION, NJ - September 29, 2026 -

Guardian Recovery - Princeton Detox & Recovery Center has introduced a new residential inpatient program designed to provide a seamless full continuum of care for New Jersey residents seeking treatment for substance use disorders. The expansion allows individuals to progress from medically supervised detoxification through residential care and onward to outpatient services without transferring between facilities or providers.

The new offering addresses a common gap in addiction treatment, where individuals often must move between separate organizations as their recovery needs change. By keeping each phase of care within a single connected system, the center aims to reduce disruptions during the recovery process and support long-term outcomes for those in its care.

The residential inpatient level of care provides a structured, around-the-clock environment where individuals live on-site while receiving clinical treatment, therapeutic support, and medical oversight. This setting is

intended for those who benefit from a stable, supervised space as they establish the foundation of their recovery before transitioning to less intensive levels of care.

Keesha Scott, speaking for Guardian Recovery - Princeton Detox & Recovery Center, said the addition reflects a deliberate effort to remove obstacles that patients frequently encounter during treatment.

"Individuals often lose momentum when they are forced to change facilities in the middle of their recovery," Scott said. "By offering a connected pathway from detox through residential and outpatient care, patients can focus on healing rather than navigating transfers between different organizations."

The center's Princeton Detox & Recovery Center inpatient treatment programs incorporate evidence-based clinical approaches, individualized treatment planning, and coordinated medical and behavioral health services. Care teams work with each patient to develop plans that account for their history, co-occurring conditions, and personal goals throughout the recovery journey.

Scott noted that continuity of care is a central factor in supporting sustained recovery. "When the same clinical team understands a patient's history from the first day of detox through residential treatment, that continuity strengthens the entire process," she said. "The goal is to provide consistent support at every stage rather than a series of disconnected episodes of care."

The residential program is available to adults across New Jersey and is designed to serve individuals at varying stages of substance use disorder. By expanding its levels of care, the center broadens access to comprehensive treatment for residents throughout the region who require more intensive support than outpatient services alone can provide.

Guardian Recovery - Princeton Detox & Recovery Center is a substance use disorder treatment provider serving New Jersey residents. The center offers a range of services spanning medical detoxification, residential inpatient care, and outpatient programming, delivered through coordinated clinical teams. The organization focuses on providing a connected continuum of care that supports individuals from the earliest stages of treatment through ongoing recovery, with an emphasis on evidence-based practices and individualized treatment planning.
