

Sarkinen Industrial Pipelining Expands Robotic Pipeline Services Across Washington and Oregon

October 01, 2026

VANCOUVER, WA - October 01, 2026 -

Sarkinen Industrial Pipelining has expanded its trenchless infrastructure repair capabilities with an increased focus on robotic pipe rehabilitation for municipalities, ports, and commercial properties throughout Washington and Oregon. The expansion centers on the company's use of Schwalm robotic systems, which allow crews to clear blockages such as concrete and steel and to complete lateral repairs without excavating the surrounding site.

The move responds to growing demand from public agencies and industrial property managers seeking to repair aging pipelines while minimizing surface disruption. Sarkinen Industrial Pipelining's robotic pipeline services address pipe systems ranging from 3 inches to 36 inches in diameter, covering sewer, storm, and wastewater lines that serve both dense urban corridors and large industrial facilities.

Robotic pipeline cutting works alongside the company's other trenchless offerings, including Cured In Place Pipelining (CIPP), Closed Circuit Television (CCTV) inspections, vac truck services, and trenchless mainline

repairs and jetting. CIPP rehabilitates broken or failing pipes from 4 inches to 24 inches in diameter using UV or steam curing techniques, while high-definition CCTV cameras inspect lines from manhole to manhole to identify blockages, cracks, and other damage before repairs begin.

"Robotic systems allow crews to reach and repair problem areas that once required tearing up roads, parking lots, and landscaping," said a representative of Sarkinen Industrial Pipelining. "By pairing robotic cutting with camera inspection and cured-in-place lining, the team can diagnose and resolve a pipeline issue in a single coordinated process, often without a single shovel touching the ground."

The company holds certifications in advanced robotic pipeline repair, LightRay technologies for pipe inversion and shorty repairs, and the CIPP rehabilitation method, and it complies with recognized industry standards for pipeline assessment. Crews also carry safety credentials including OSHA, confined space safety, OSHA 10, and OSHA 30 training, which are frequently required for work on government and port infrastructure projects.

Sarkinen Industrial Pipelining in Vancouver, WA serves a broad client base that includes municipalities, government and state agencies, city departments, ports, industrial and commercial properties, and homeowners associations. The company provides free on-site estimates and maintains availability at all hours, including holidays and weekends, to support agencies managing emergency pipeline failures.

"Aging pipe infrastructure across the region is a shared challenge for public and private property owners alike," the representative added. "Expanding robotic capabilities gives clients a practical path to extending the life of existing systems without the cost and disruption of full excavation."

The company continues to invest in trenchless technology as regional infrastructure ages and property owners look for repair methods that limit environmental and community impact. By combining robotic cutting, vac truck cleaning, descaling, root removal, and steam or UV lining, Sarkinen Industrial Pipelining offers a coordinated approach to pipeline maintenance and repair.

Sarkinen Industrial Pipelining is a pipe repair, lining, jetting, and video inspection provider based in Vancouver, WA, serving clients throughout Washington and Oregon. The company specializes in trenchless and no-dig solutions for pipe systems ranging from 3 inches to 36 inches in diameter and works with municipal, industrial, commercial, and residential association clients across the region.
