

Wright Lumber & Millwork Expands Deck Material Selection for St. Michael Projects

September 30, 2026

September 30, 2026 -

Wright Lumber & Millwork has expanded its selection of decking products for homeowners, contractors, and other customers planning outdoor construction projects in the St. Michael area. The expanded inventory of deck materials and supplies in St Michael, MN gives customers additional options when selecting products for new deck construction, renovations, repairs, and other outdoor living projects.

The expansion comes as outdoor spaces continue to play an important role in residential improvement projects. Decks can provide homeowners with functional areas for relaxing, gathering, dining, and other activities while extending usable living space beyond the interior of a home. Because decks are continuously exposed to the elements, material selection is also an important consideration when planning a project, particularly in Minnesota, where outdoor structures encounter changing seasonal conditions throughout the year.

Wright Lumber & Millwork's expanded selection includes multiple types of decking materials intended to accommodate different project requirements and design preferences. Among the available options are composite decking products, which provide an alternative to traditional wood decking. Composite materials are commonly considered by homeowners interested in durability and reduced maintenance requirements.

The company's decking selection also includes pressure-treated wood and hardwood options. These materials provide additional choices for customers who prefer the appearance and characteristics of wood when planning an outdoor space. By offering multiple material categories, Wright Lumber & Millwork allows homeowners and contractors to evaluate factors such as appearance, maintenance, durability, project requirements, and overall design before selecting products.

Deck construction involves more than choosing the surface boards. Railings and related components also influence a deck's appearance and functionality. As part of its expanded inventory, Wright Lumber & Millwork offers railing options that can be incorporated into different deck layouts and designs. Customers can consider these components alongside decking materials when developing a more complete plan for their

outdoor projects.

The broader selection is relevant to both professional contractors and homeowners completing their own projects. Contractors frequently need access to different materials to accommodate project specifications and customer preferences, while do-it-yourself customers may need additional information before determining which products are appropriate for their plans.

Recognizing the importance of planning, Wright Lumber & Millwork also provides online information intended to help customers learn more about deck projects. Resources address topics related to material selection, maintenance, and deck design, giving homeowners an opportunity to research considerations that may affect their projects before construction begins.

Material selection can have long-term implications for an outdoor structure. Different decking products vary in appearance, maintenance requirements, and other characteristics, making it important for customers to consider how a deck will be used and maintained. Climate and exposure to outdoor conditions may also influence decisions about materials and project design.

The expansion of deck materials and supplies in St Michael, MN reflects the variety of choices now available for residential deck construction. Rather than relying on a single type of decking, property owners can compare wood and composite options and consider complementary components such as railings as part of the overall project.

Local contractors have also noted the practical value of having multiple decking choices available within the community. Steve Marshall, a contractor in St. Michael, said that access to a diverse selection of local deck materials can help contractors and their clients evaluate products while also obtaining information relevant to project planning and construction.

For homeowners, these choices can support a range of outdoor configurations. A deck may be planned as a compact extension of an existing living area or as a larger space designed for several outdoor activities. The appropriate materials and components depend on the property's layout, the intended use of the space, maintenance preferences, and the design goals established for the project.

As residential outdoor spaces continue to receive attention, access to product information can help property owners understand the differences among available materials before beginning construction. Reviewing decking types, railing options, maintenance considerations, and design possibilities early in the planning process can also help establish clearer expectations for a project.

Wright Lumber & Millwork's expanded decking inventory provides St. Michael-area homeowners and contractors with additional material choices for new construction and improvements to existing outdoor spaces. Customers interested in learning more about the company's decking products and project resources can visit Wright Lumber & Millwork's website or contact the company for additional information.
