Peptides Costa Rica Introduces All-in-One Customer App for Research Buyers

October 05, 2026

Jacó, Puntarenas - October 05, 2026 -
Peptides Costa Rica has launched a new customer application that consolidates product browsing, ordering, and account management into a single platform for research professionals operating within Costa Rica. The company, a supplier of research-grade peptide products, developed the tool to streamline how independent researchers, clinical teams, laboratory staff, and professional buyers access its inventory.

The Peptides Costa Rica Mobile App brings the full PCR product catalog directly to users' devices, allowing them to review product information, batch documentation, and availability from one location. Customers can track orders and receive updates on availability through the same interface, reducing the need for separate communication channels.

The application reflects the company's focus on local reliability. Because inventory is held within Costa Rica, orders placed through the platform are not subject to customs delays or hidden import charges. The company serves customers exclusively within the country and confirms payment options during checkout.

"The application was built to reduce friction for the research community we serve," said Joey Webster,

spokesperson for Peptides Costa Rica. "Buyers can now view the catalog, check batch documentation, and follow an order from a single screen rather than moving between messages and separate pages."

Through the app, users can explore products organized by research category, including compounds studied for energy, healing, muscle growth, metabolism, and longevity. Each product listing links to independent Certificates of Analysis issued for every batch, maintaining the transparency the company has emphasized since its founding.

"Transparency has always guided how the company operates," Webster added. "Placing the catalog, pricing, and certificates of analysis in one place allows researchers to make informed decisions with the documentation directly in front of them."

The company's products have previously been featured in The Costa Rica News and The Tico Times. The new platform continues the company's effort to provide direct communication and reliable local delivery within Costa Rica.

The PCR product catalog available within the app includes a broad selection of peptides such as BPC-157, CJC-1295, GHK-Cu, Epithalon, Ipamorelin, Semax, and Tesamorelin, alongside metabolic and GLP-1 research compounds. All items are documented with clear pricing and batch information.

All products offered through the Peptides Costa Rica Mobile App are intended strictly for laboratory research use. They are not approved to prevent, diagnose, treat, or cure any disease and are not suitable for human or veterinary use. Purchasers must be at least 21 years old.

Peptides Costa Rica specializes in the production and distribution of research-grade peptide products for the scientific community within Costa Rica. The company organizes its offerings by research application and maintains an information center where users can learn more about peptides and their studied uses. With inventory held locally, Peptides Costa Rica provides independent Certificates of Analysis for each batch, clear product information, and dependable local delivery for independent researchers, clinical teams, laboratory staff, and professional buyers.
