

J and N Custom Renovations Announces Eco-Homes Initiative

October 02, 2026

October 02, 2026 -

J and N Custom Renovations, a home builder in La Grande, OR, has announced the launch of its new Eco-Homes Initiative, a service focused on incorporating sustainable construction practices into residential building projects throughout Eastern Oregon. The initiative is designed to address growing interest in energy efficiency, resource conservation, and environmentally responsible construction while maintaining the quality and functionality expected in modern homes.

Founded by industry veterans John Doe and Nancy Smith, J and N Custom Renovations has provided home building and renovation services in the La Grande area. The company developed the Eco-Homes Initiative in response to changes within the residential construction industry, including increased interest in energy-efficient housing and building practices designed to reduce environmental impact.

The initiative incorporates a range of sustainable construction considerations, including energy-efficient systems, improved insulation, water-conservation measures, and environmentally conscious material selections. The approach is intended to help reduce energy and water consumption while creating residential spaces designed for the regional climate and conditions of Eastern Oregon.

As part of the development process, J and N Custom Renovations has researched sustainable building technologies and considered feedback from clients and industry professionals. The company has also examined the climatic and geographic characteristics of the La Grande area when determining which building strategies may be appropriate for local residential projects.

Planned features may include designs that make effective use of natural light, insulation strategies intended to improve indoor temperature control, and energy-efficient appliances and mechanical systems. These elements can play a role in reducing household resource consumption while supporting the long-term functionality of residential properties.

John Doe, co-founder of J and N Custom Renovations, said the Eco-Homes Initiative was developed to bring

sustainable construction considerations into the company's residential building services. "The Eco-Homes Initiative is tailored for those who are looking to blend luxury with sustainability, ensuring long-term savings and minimal environmental impact," Doe said.

In addition to changes in construction practices, the Eco-Homes Initiative will include educational opportunities for residents and prospective homeowners in the community. J and N Custom Renovations plans to host informational workshops and seminars addressing topics related to sustainable construction, energy ratings, resource conservation, and available incentives for qualifying environmentally focused building and renovation projects.

The educational component is intended to provide members of the community with information about the construction decisions that can influence a home's energy and resource use. The planned sessions will also provide an opportunity to discuss emerging technologies and building practices with homeowners and others interested in sustainable residential development.

The initiative is also expected to incorporate materials and services sourced within Oregon when practical. By considering regional suppliers and sustainable material options, J and N Custom Renovations aims to support local economic activity while limiting transportation-related environmental impacts associated with construction materials.

Nancy Smith, co-founder of J and N Custom Renovations, emphasized the company's focus on collaboration as the initiative develops. "We are partnering with leading suppliers and green technology experts to ensure that our products meet the highest standards of sustainability and quality," Smith said.

The launch of the Eco-Homes Initiative comes as residential construction continues to incorporate new approaches to energy efficiency and environmental responsibility. For builders operating in Eastern Oregon, local climate conditions, resource availability, and homeowner needs can all influence how sustainable construction practices are applied to individual projects.

J and N Custom Renovations will continue developing the initiative as new building technologies and sustainable construction methods become available. The company also plans to use community education and industry collaboration as part of its broader effort to expand awareness of sustainable residential construction in the La Grande area.

Residents, prospective homeowners, and members of the local construction community interested in learning more about the Eco-Homes Initiative can contact J and N Custom Renovations for additional information. As

a home builder in La Grande, OR, the company will provide information about available services, sustainable construction options, and upcoming educational events.
