

VidOvation Expands Enterprise IPTV Solutions With New Features

October 07, 2026

ANAHEIM, CA - October 07, 2026 -
VidOvation has announced an expansion of its Enterprise IPTV Solutions, adding video distribution, content management and analytics capabilities to its enterprise offering. The announcement addresses the continued use of video for corporate communications, training and stakeholder communications across distributed work environments. The expanded offering forms part of VidOvation?s broader portfolio of video, audio and data communication systems.

The expanded offering includes live streaming, video-on-demand and customizable content delivery. The platform supports multiple content formats and access through desktops, smartphones and tablets. VidOvation also describes the service as scalable across organizations of different sizes, from small businesses to large multinational corporations. The company?s IPTV offering is available within its enterprise technology portfolio.

The announcement comes as remote and hybrid work arrangements remain part of the workplace environment for many organizations. Internet-based video is used in corporate settings for training, internal communications and stakeholder engagement. IPTV platforms distribute television and video programming

over internet protocol networks, allowing content to be delivered through network-connected devices rather than through traditional television distribution methods.

Jim Jachetta, Executive Vice President and Chief Technology Officer of VidOvation, said the expansion reflects increased demand for enterprise video technology. ?The demand for video solutions in the enterprise sector has never been higher,? Jachetta said, describing the offering as a set of tools for organizations using video for workplace communications. Jachetta also said the company?s enterprise offering provides flexibility in how organizations use video across their communications activities.

VidOvation?s Enterprise IPTV platform operates within existing corporate infrastructure and includes configurable content delivery. The offering combines live and on-demand video distribution with support for multiple content formats and device types. Its analytics capabilities provide information about viewer engagement, giving organizations access to data associated with content viewing and usage.

The offering applies to organizations in corporate, broadcast, government and venue environments. VidOvation provides video, audio and data communication systems across these sectors, with its broader services covering video transmission and distribution. The enterprise IPTV platform is also described as applicable to companies of varying sizes and to organizations with audiences accessing content from different locations.

The expansion is accompanied by educational resources and industry material related to IPTV implementation and content strategy. VidOvation has also outlined continued support and expertise related to its video technology offerings. The additional materials are intended to cover topics associated with implementing and managing IPTV within organizational environments, according to information provided by the company.

VidOvation provides video, audio and data communication systems and serves corporate, broadcast, government and venue markets across the United States. Its services include video transmission and distribution, with projects spanning the process from concept through implementation. The company information provided for this announcement does not identify a founding year or headquarters location, so those details are not included.

The Enterprise IPTV solutions expansion adds another category to VidOvation?s existing video technology portfolio, which includes services for organizations working with video, audio and data communications. The company?s stated areas of service include corporate communications, broadcast operations, government applications and venues, while its IPTV offering includes live and on-demand content, configurable delivery, device compatibility and viewer analytics.
