

Azure Med Spa Introduces Non-Invasive Postpartum Incontinence Therapies in Frisco

October 07, 2026

FRISCO, TX - October 07, 2026 -

In this release, Azure Med Spa, a premier medical aesthetics and wellness practice in Frisco, Texas, has released new clinical guidance highlighting specialized postpartum urinary incontinence therapies to help mothers restore pelvic floor function and improve their quality of life. In this release, Azure Med Spa discusses urinary incontinence after childbirth and how a personalized assessment can inform treatment recommendations.

A new mother in Frisco may notice a small urine leak when lifting her baby from the crib. When it happens again during a short walk, she may worry about managing the problem outside the house, especially when reviewing what to know about urinary incontinence after childbirth from Azure Med Spa to better understand her options before bringing it up at her next appointment.

Pregnancy places added pressure on pelvic floor muscles, which support the bladder and help control urine flow. As the uterus grows, this support may weaken even before labor begins.

Vaginal delivery may also stretch supporting tissues or affect nerves involved in bladder function. A C-section does not eliminate the possibility of leakage because pregnancy itself can strain these structures. Even pregnancy-related hormonal changes may affect pelvic tissue support. Risk can also be higher after a long labor or an assisted vaginal delivery.

By conducting a personalized assessment, Azure Med Spa helps Frisco-area patients identify the precise underlying causes of their postpartum symptoms and determine targeted, non-invasive therapeutic solutions to restore strength and confidence.

Postpartum leakage may manifest in a few distinct patterns, including stress incontinence, where urine leaks when physical pressure, such as coughing or lifting, is placed on the bladder, and urge incontinence, which involves a sudden, strong need to urinate followed by leakage before reaching a toilet. Additionally, individuals may experience mixed incontinence, a combination where leakage occurs both during physical effort and following a sudden, intense urge to urinate.

Patients can contact Azure Med Spa to discuss their symptoms. During childbirth recovery, tissue healing and changes in pelvic floor function may gradually improve bladder control. The time needed for symptoms to improve varies, making comparisons with another mother's recovery unreliable. Improvement in urinary incontinence after childbirth may mean leaking less often or losing less urine during each episode.

A clinician may recommend pelvic floor exercises, with technique and frequency tailored to the individual. Medical guidance on fluid intake can help avoid unnecessary restriction, while managing constipation may reduce straining. Returning to workouts should follow maternity care advice, especially after a C-section or complications. Urinary leakage during activity is a reason to discuss whether the exercise or intensity needs adjusting.

Frisco mothers should seek medical advice when leakage worsens or disrupts daily activities. They do not need to wait for a scheduled postpartum appointment to raise concerns. Pain or burning during urination warrants prompt evaluation because it may indicate an infection. Difficulty emptying the bladder also needs medical attention, while an inability to pass urine requires immediate care.

For patients reporting bladder weakness, an assessment may begin with a review of delivery history and symptom timing. A diary of fluid intake and bathroom visits can help reveal patterns. An examination may assess pelvic floor strength and the ability to fully relax the muscles.

Azure Med Spa offers consultations for postpartum bladder concerns. Its team considers each woman's symptoms and stage of recovery when assessing the suitability of treatment. Options include FormaV

radiofrequency therapy for vaginal tissue and VTone electrical stimulation for pelvic floor muscle rehabilitation.

Frisco women experiencing urinary incontinence after childbirth can call (972) 294-6992 to schedule a consultation.
