

Cassones RV Issues Guidance on Generator Maintenance Practices

October 13, 2026

MESA, AZ - October 13, 2026 -

Cassones RV has issued operational guidance on generator maintenance for recreational vehicles as owners prepare units for fall travel and cooler weather conditions. The guidance draws from the dealership's RV service department practices in Mesa, Arizona, where technicians address engine and generator systems as part of routine preventive care. Reliable onboard power remains relevant for owners who use units for extended trips, remote stays, or periods when shore power is unavailable.

Generator service forms a standard element of the company's maintenance offerings. Technicians perform oil changes, lubrication, and filter replacements on both engines and generators. These steps help maintain dependable operation whether a unit is used for boondocking or during temporary power outages. The same preventive approach includes multi-point inspections that identify wear before it affects travel plans.

"Generators see consistent use in desert environments where owners travel beyond full-hookup sites or need backup power during seasonal conditions," said Richard Phelps, Owner of Cassones RV. "Routine service on the unit, including oil and filters, supports continued reliability for the travel periods ahead."

Arizona operating conditions influence the timing of this work. Heat and dust accelerate wear on mechanical components, and the transition from high summer temperatures to milder fall weather presents an opportunity to complete inspections before longer trips. The service department handles generator maintenance and repair across multiple RV classes, including diesel pushers, Class A and Class C motorhomes, and towable units equipped with onboard generators.

Slide-out mechanisms and related systems often receive concurrent attention during the same service visits. Misalignment or lack of lubrication can interrupt operation, and technicians adjust and maintain these components as part of broader system diagnostics. Roof and exterior evaluations may also occur, given the exposure of seals and materials to ultraviolet radiation and temperature swings that affect long-term integrity.

The company includes a complimentary multi-point inspection with major service appointments. This process reviews mechanical, electrical, and structural items to document condition before owners depart for travel. Generator-specific work fits within this workflow, allowing technicians to address power systems alongside other interconnected components such as HVAC units and leveling mechanisms.

“The goal of the inspection process is to identify issues that can be addressed in the service bay rather than during a trip,” added Phelps. “Generator maintenance is one element of that evaluation for owners who rely on onboard power.”

Cassones RV maintains service capabilities for a range of brands commonly found in pre-owned inventory, including Tiffin, Newmar, Forest River, Jayco, and Grand Design. Technicians apply manufacturer service intervals where applicable and document findings for owners. The approach supports long-term ownership by combining mechanical upkeep with assessments of systems that experience seasonal stress.

In the pre-owned segment, documented generator and systems service contributes to operational readiness for subsequent travel seasons. Units that receive regular oil changes, filter service, and inspections demonstrate consistent mechanical care. The dealership’s operations integrate these tasks with collision and body work, roof repairs, and general maintenance so that a single facility can address multiple aspects of vehicle condition.

Cassones RV operates as a provider of pre-owned recreational vehicles with full service, collision and body repair, roof restoration, and consignment capabilities. Inventory includes diesel pushers, Class A, Class B, and Class C motorhomes along with fifth wheels, travel trailers, and toy haulers. Service department workflows encompass routine maintenance, generator work, slide-out repairs, HVAC service, and structural assessments for units based in the region.
