

Congleton All-on-4 Dental Implants Consultation Capacity Expanded From October 2026 at Crown Bank Dental Congleton

October 15, 2026

CONGLETON, UK - October 15, 2026 -

Crown Bank Dental Congleton has expanded its implant consultation capacity from October 2026, opening more appointment slots for patients across Cheshire considering All-on-4 dental implants for full-arch teeth replacement. The additional availability is aimed at those living with the daily consequences of missing teeth, for whom accessing timely implant consultations has not always been straightforward.

All-on-4 dental implants refer to a treatment concept in which four titanium posts are placed into the jawbone to support a full arch of replacement teeth, and has become a widely recognised term within implant dentistry for full-arch restoration. Where treatment is clinically successful and osseointegration ? the process by which the implant fuses with the surrounding bone ? is achieved, the resulting restoration is generally intended to remain stable during eating, speaking, and other daily activities, though individual outcomes vary depending on patient-specific factors and adherence to post-treatment care. The four-implant approach is designed to maximise the use of available bone, though anatomical suitability varies between patients and can only be determined through individual clinical assessment. In some cases, adjunctive procedures may be required before implant placement can proceed.

The consultation process begins with the dental team assessing jawbone density, gum health, and overall suitability for treatment. Scans and imaging form part of this assessment, giving the dentist a detailed view of the bone structure before any treatment planning begins. The implant dentist will discuss clinical considerations relevant to each patient's situation during the appointment, ensuring decisions are made with a full understanding of what treatment involves and what to expect at each stage.

Treatment insights regarding All-on-4 dental implants for full-arch replacement are available at: <https://www.crownbankdental.co.uk/treatments/dental-implants/>.

A longitudinal study titled "A Longitudinal Study of the Survival of All-on-4 Implants in the Mandible With Up to 10 Years of Follow-Up", published in the Journal of the American Dental Association in March 2011 (DOI: 10.14219/jada.archive.2011.0170) by Malo P, de Araújo Nobre M, Lopes A, Moss SM, and Molina GJ, reported cumulative implant-related success rates of 98.1% at five years and 94.8% at ten years across 245 patients, with an overall prosthesis survival rate of 99.2%. These findings are specific to the mandible and to the patient population studied and should not be generalised as expected outcomes for all patients or for treatments carried out at Crown Bank Dental Congleton. They do, however, provide relevant published context for the role that structured treatment planning and long-term follow-up play in full-arch implant outcomes.

In certain cases where clinical assessment confirms suitability and bone condition specifically supports immediate loading, temporary teeth may be fitted on the same day as implant placement. This is not a routine outcome and depends entirely on individual clinical circumstances determined at assessment. Where same-day loading is not indicated, patients follow a staged treatment timeline, with permanent teeth fitted once the implants have fully integrated with the surrounding bone.

Those wishing to learn about single dental implant consultations can visit: <https://www.crownbankdental.co.uk/treatment/single-dental-implants/>.

Not every patient presenting with tooth loss requires a full-arch solution. Consultations for single dental implant placements are also available at Crown Bank Dental Congleton, addressing situations where one tooth is missing rather than a complete arch. A single implant involves placing one titanium post into the jawbone, supporting a crown matched to the surrounding natural teeth in appearance and function. Where treatment is successful and clinical circumstances are favourable, single implants can function in a manner broadly comparable to a natural tooth during biting and chewing.

Crown Bank Dental Congleton serves patients across the wider Cheshire area, offering treatments covering both general and specialist dental care. The team works with patients across different backgrounds and dental histories, placing emphasis on clear communication so patients understand their options before proceeding. Nervous patients are accommodated at the practice, with the team taking additional time to explain procedures and address concerns before any treatment begins.

Practice information, including details about the dental team, can be found at:
