

Tuck & Howell Plumbing, Heating & Air Highlights Warning Signs That Indicate Aging Home Pipes May Need Repiping

October 21, 2026

HENDERSONVILLE, NC - October 21, 2026 -
Homeowners across Hendersonville who notice recurring leaks, discolored water, or persistent corrosion may be living with a plumbing system nearing the end of its service life, according to guidance issued by Tuck & Howell Plumbing, Heating & Air. The company is drawing attention to the warning signs that often precede a full repiping project, helping residents understand when aging pipes warrant a professional evaluation.

Many homes built decades ago still rely on original piping materials that can degrade over time. As those systems age, small problems tend to multiply. Repeated leaks in different areas of a home, rusty or brown-tinted water at the tap, reduced water pressure, and visible corrosion on exposed pipes are among the indicators that a piping system may require more than a simple repair. When these issues appear together or recur frequently, a comprehensive assessment can determine whether repiping is the appropriate solution.

Discolored water, in particular, can signal interior pipe corrosion. As metal pipes break down, sediment and rust may enter the water supply, affecting both the appearance and quality of household water. Ongoing pipe problems that resurface shortly after being patched can also point to deterioration that spot repairs cannot resolve.

Tuck & Howell Plumbing, Heating & Air provides plumbing evaluation and repiping services designed to address these underlying conditions rather than treat individual symptoms. A professional inspection examines the condition of the overall piping system, identifies failing sections, and determines whether a full replacement would better protect a home from future water damage and supply issues.

"When a homeowner is dealing with the same leak for the third or fourth time, that is usually the system telling a story," said Jay Mahaffey, owner of Tuck & Howell Plumbing, Heating & Air. "Aging pipes rarely fail all at once. They show signs over time, and recognizing those signs early gives families the chance to plan a repair or repiping project before a minor issue becomes a major one."

The company notes that corrosion concerns and water quality changes are often overlooked until they become disruptive. By encouraging residents to pay attention to these early indicators, the firm aims to help households make informed decisions about the condition of their plumbing.

"The goal is to give people a clear understanding of what is happening behind their walls," Mahaffey added. "A thorough evaluation of the piping system removes the guesswork and allows a homeowner to weigh their options based on facts rather than uncertainty."

Tuck & Howell Plumbing, Heating & Air in Hendersonville continues to serve area residents with assessments focused on the long-term reliability of residential piping. The company emphasizes that regular attention to plumbing conditions can reduce the risk of unexpected failures and the water damage that frequently accompanies them.

Tuck and Howell is a service company specializing in air conditioning, heating, and plumbing. Its plumbing offerings include water treatment, sewers, drains, water heaters, backflow services, and repiping. The company also provides heating and cooling installation, maintenance, and repair, along with related services such as ductwork, indoor air quality, and crawlspace encapsulation.
