

Trex Lighting Launch Gives Deck It Customers New Design Choices

October 23, 2026

FRAMINGHAM, MA - October 23, 2026 -

Trex introduced a redesigned deck-lighting collection on September 2, 2026, with fixtures for stairs, railing and posts. For Central Massachusetts homeowners considering a new deck or changes to an existing one, the news brings a concrete set of lighting options into the design conversation. Deck It offers deck-lighting design consultation and installation alongside deck construction, and its published lighting service identifies Trex among the lighting brands it works with. Planning the light before the deck is finished can make fixture placement, controls and access part of one coordinated layout.

The manufacturer's announcement identifies four fixture formats: linear riser lights that trace a stair step, oval riser lights, post-cap lights in three profiles and an under-rail light designed to be trimmed across Trex railing systems. Trex also lists a dimmer and remote, transformer and timer, six-way splitter and extension wires. Those details describe the new collection, not a promise that every component will fit every existing deck or railing.

Stairs are a useful starting point for a lighting plan. A deck may connect a back door to a landing, another flight of steps and a route into the yard. The homeowner needs to recognize each transition after dark without pointing a fixture into a seated guest's eyes or across a property line.

Trex describes its new lighting as directing light downward. Its linear and oval riser formats give designers different ways to illuminate a step. The better choice depends on the actual stair dimensions, mounting locations and desired appearance, not a catalog photo alone.

Railings and post caps pose a different question. Continuous under-rail light can define an edge more evenly than separate fixtures at posts. A post-cap light may be more prominent from both the deck and the yard.

Trex says its under-rail fixture can be trimmed to suit its railing systems, while the post-cap range offers three

profiles. Before selecting either, a homeowner should compare the proposed railing components with the manufacturer's product-specific instructions. An existing railing may call for a different mounting approach from a new structure still being designed.

Controls are worth settling before the final fixture count. Trex lists a dimmer and remote with brightness control from 1 to 100 percent, and a transformer and timer with dusk sensing and customizable scheduling. That presents choices about when the lights come on and how bright individual areas should feel.

A stair or entry route may call for a different plan from a conversation area. The announcement does not mean a lighting package is automatically included in a deck project. The location of each fixture, the control arrangement and what installation work is included belong in the proposed project scope.

Trex describes the collection as a 24VDC low-voltage system with a UL wet-location listing and a five-year limited manufacturer warranty. Those product descriptions still require a check of installation instructions, compatibility and the written warranty terms for the components selected. They do not replace a check of the specific installation scope. Deck It offers lighting design consultation and installation; the fixtures and controls suitable for a particular property need to be identified in that project's proposal.

The fall design window is a chance to make decisions before finishes and access routes are fixed; it is not a manufacturer-imposed deadline. A homeowner can sketch where people enter, descend, gather and move into the yard, then discuss fixture locations and controls with a deck-lighting installer. For an existing deck, the same conversation should begin with its actual railings, steps and accessible mounting points.

A homeowner comparing a retrofit with a new build should ask whether existing surfaces allow the desired fixture positions, which components need replacement, and whether the proposed controls can be reached conveniently. That comparison can prevent a design chosen for a newly built deck from being treated as a universal retrofit plan. Trex's September launch supplies new products to compare. A property-specific plan determines whether any of them belongs in the work.
