State 48 Powersports Defines the Differences Between UTV Parts Installation, Wiring and Fabrication

October 23, 2026

MESA, AZ - October 23, 2026 -
State 48 Powersports is drawing attention to the distinct types of work involved in customizing utility terrain vehicles, including parts installation, electrical wiring, fabrication, and full rebuilds. The company lists these as separate areas of its UTV service and customization operations, reflecting the range of work that may be involved when an owner seeks changes beyond routine maintenance or repair.

Parts installation is one part of the customization process. State 48 Powersports provides recommendations on specific parts and kits and installs selected components. The company also offers parts and accessories from established brands and specialized fabricators. Individual installations vary according to the component selected and the vehicle involved, making the distinction between fitting an existing part and undertaking a broader custom project important when defining the scope of work.

Electrical wiring represents a separate technical category. State 48 Powersports describes its wiring service as professional electrical work performed by specialists. Unlike a straightforward parts installation, wiring involves the electrical connections required for the selected equipment. Some customization projects may involve both component installation and electrical work, although the company's published service information

does not suggest that every upgrade requires wiring or that all vehicles follow the same configuration.

Fabrication addresses a different requirement. The company describes fabrication as custom design and manufacturing, distinguishing it from the installation of an existing part or kit. A project requiring a tailored component may involve a different scope of work from one that uses commercially available parts. The specific work depends on the design and requirements of the individual vehicle; fabrication is not necessarily part of every customization project.

These separate capabilities help explain why the term custom UTV wiring and fabrication describes more than one type of technical work. Wiring concerns electrical connections, while fabrication involves custom design and manufacturing. Parts installation, meanwhile, focuses on fitting selected components. A project may use one of these capabilities or combine several of them, depending on the intended result.

State 48 Powersports also lists full UTV rebuilds as part of its service offering. The company describes this work as assembling a UTV around the owner's requirements. A full rebuild therefore differs in scope from installing an individual component, although the precise work required will depend on the vehicle and the project. The company does not publish a single mandatory sequence for all builds, so the various services should not be presented as steps that every customization must follow.

Jesse Attaway, co-owner of State 48 Powersports, said, ?Custom UTV projects can involve very different types of work, from installing a selected part to coordinating wiring, fabrication, or a broader rebuild. Understanding the scope of a project helps distinguish which services are relevant to the vehicle and the changes being considered.?

The company's service page presents customization alongside full-service inspections, repairs, and assistance with insurance claims. Although these activities may involve the same vehicle, they serve different purposes. An inspection addresses the vehicle's condition, repair work responds to a fault or damage, and customization involves selected changes or a broader build. Insurance-claim assistance is another listed service related to the repair process.

The business also offers fully customized UTVs for sale through its retail operation, alongside parts and accessories. Purchasing a vehicle that has already been customized differs from modifying a vehicle an owner already has. Availability and configuration depend on the units offered at a given time; the company's published information does not guarantee that a specific vehicle, component, or build will always be available.

Understanding these distinctions provides a clearer view of the range of work covered by UTV customization. A project may focus on one part or kit, require electrical work, involve custom manufacturing, or extend to a more comprehensive rebuild. The appropriate scope depends on the individual project rather than on a

universal formula for modifying every vehicle.

State 48 Powersports is powered by Strictly UTV and Steve's Cycles. The family-owned business provides powersports vehicle sales, service, repairs, parts, accessories, and customization. Its offerings include ATVs, UTVs, motorcycles, dirt bikes, and electric powersports vehicles, with parts installation, wiring, fabrication, and full UTV rebuilds among its documented service capabilities.
