

Cover Pro Roofing Details Its CertainTeed ShingleMaster Standards

October 29, 2026

KNOXVILLE, TN - October 29, 2026 -
Cover Pro Roofing has detailed how its CertainTeed ShingleMaster certification shapes the way its crews specify and install shingle roofs for property owners in Knoxville, Tennessee. The contractor, which has worked on asphalt shingle roofs across East Tennessee since 2011, said the account responds to how often property owners ask what separates one shingle roof from another when the product named on each quote is the same.

Cover Pro Roofing provides shingle roof installation and replacement in Knoxville, and shingle roof replacement is its largest service line. The contractor holds CertainTeed ShingleMaster certification, which CertainTeed awards to roofing contractors whose installers have completed training in its shingle and accessory product systems. It is one of four manufacturer certifications Cover Pro Roofing holds, alongside GAF GoldElite, Best Buy Metals, and Soprema, and it applies across new installation, full replacement, and storm damage repair on asphalt shingle roofs.

The training behind the certification treats a shingle roof as an assembly rather than as a single product. Alongside the shingle itself sit the underlayment beneath it, the starter course at the eaves, the ice and water barrier at valleys and other vulnerable details, the hip and ridge caps, and the ventilation that allows the assembly to breathe. Cover Pro Roofing specifies each of those components as part of one system rather than selecting them in isolation. Where any one of them is substituted or left out, a finished roof can look correct from the ground while performing below the rating printed on the shingle.

That carries directly into warranty coverage. Extended manufacturer warranty programs are generally available only where a certified contractor has installed a complete system to the manufacturer's specification. Because Cover Pro Roofing holds the ShingleMaster certification, the roofs its crews install can qualify for coverage reaching past the shingle to the accessory components beneath it. A roof assembled from mixed components by an installer without the certification may carry a shingle warranty and nothing further, leaving the underlayment, flashing, and ventilation outside any coverage.

"We have been replacing shingle roofs across East Tennessee for more than fifteen years, and the parts that decide how long one lasts are mostly the parts a homeowner never sees," said Mike Martin, Owner of Cover Pro Roofing. "Carrying the certification means our crews are trained to the manufacturer's specification, and the roof ends up qualifying for coverage that an installation outside that specification would not."

East Tennessee conditions give that specification more weight than it would carry in a milder climate. Properties across the Knoxville area contend with summer heat and humidity, spring and summer thunderstorm activity, hail, and periodic high winds, each of which tests a different part of the assembly. Wind resistance depends heavily on nailing pattern and placement rather than on the shingle rating alone, while attic temperature and moisture depend on whether intake and exhaust ventilation have been balanced correctly. An imbalance between soffit intake and ridge exhaust shortens shingle life from beneath the deck, whatever is happening on the weather side.

Cover Pro Roofing installs designer, laminate, and synthetic shingle profiles, with rated service life varying by profile and by exposure conditions. Profile and color are selected against roof pitch, elevation, and the surrounding streetscape rather than from a sample board alone, and the choice is discussed with the property owner before the order is placed. Further detail on the range is set out on the shingle roofing page.

Several failure points recur often enough to be predictable, and most trace back to installation rather than to product. Valley details relying on a single layer of underlayment, exposure spacing that drifts wider than specification across a long run, and fasteners driven above the nailing line are common findings on roofs that fail early. Each of those is invisible from the ground once the roof is complete, which is why project managers carry out on-site quality checks while the work is in progress rather than after it.

Cover Pro Roofing has worked across East Tennessee since 2011 and carries more than fifteen years of roofing experience across shingle, flat, and metal systems. The contractor is BBB accredited with an A+ rating and is licensed and insured. Complimentary roof inspections are offered, financing options are available, and the contractor corresponds directly with insurers on behalf of property owners where storm damage forms part of a claim. Further information about the roof systems installed is available on the contractor's website, and project updates are posted on its Facebook page.
