ITS Environmental Services Raises Awareness of Hidden Biohazard Risks in Residential and Commercial Properties

November 17, 2026

YAPHANK, NY - November 17, 2026 -
ITS Environmental Services is drawing attention to a frequently overlooked danger facing property owners across New York and the Tri-State area: biohazard contamination that extends far beyond what is visible to the eye. The company is working to educate the public about the distinction between ordinary surface cleaning and professional biohazard remediation following incidents involving blood, bodily fluids, and other biological materials.

According to the company, many property owners assume that a contaminated area is safe once visible traces have been removed. In reality, blood and other biological materials can penetrate flooring, subfloors, walls, furniture, and other porous surfaces. This means that cleanup often requires far more than a standard cleaning effort, and improper handling can leave hidden hazards in place.

Professional biohazard cleanup involves a series of specialized steps that untrained individuals are typically unable to perform safely. Trained technicians assess the full scope of contamination, use appropriate personal protective equipment, identify affected materials that may need removal, and carry out targeted

cleaning and disinfection. The objective is not simply to make a space appear clean, but to address the underlying biological hazards that could compromise safe occupancy.

"What a property owner can see is often only part of the problem," said Doug Baruchin of ITS Environmental Services. "Biological materials can soak into surfaces that look untouched, and attempting to clean these areas without proper training and equipment can expose people to serious health risks. Professional biohazard remediation requires specialized knowledge and meticulous attention to detail."

The company provides a full range of biohazard cleaning services, including crime scene cleanup, unattended death cleanup, blood cleanup, trauma cleanup, and suicide cleanup. In each case, technicians approach the work with both the technical rigor required for safe decontamination and the discretion appropriate to sensitive circumstances.

"Our goal is to restore a space so that it can be used safely again, not just so that it looks acceptable at a glance," Baruchin said. "Every situation is different, and the work calls for a careful, methodical process rather than a quick fix."

To support property owners who may be uncertain about the extent of contamination they face, ITS Environmental Services offers free onsite estimates within 30 miles of its location in Yaphank, New York. An onsite assessment allows trained personnel to evaluate the affected area directly and determine the appropriate remediation approach.

The company emphasizes that the key message for the public is straightforward: what cannot be seen can matter just as much as what can. Biohazard contamination that remains after an untrained cleaning attempt may continue to pose risks to anyone who uses the space.

ITS Environmental Services is a certified biohazard cleanup and extreme disinfection company helping families, businesses, and industrial facilities in New York and the Tri-State area. The company maintains emergency availability around the clock for situations requiring an immediate response.
