SOCO Surfaces Broadens Residential and Commercial Countertop Fabrication and Installation Services

November 12, 2026

COLORADO SPRINGS, CO - November 12, 2026 -
SOCO Surfaces, a local family-owned business operating in Colorado, has announced expanded service capacity for countertop installation in Colorado Springs, CO, increasing project availability for residential and commercial renovations. Operating from its local showroom and fabrication facility, the company has broadened its installation scheduling, expanded its inventory of natural and engineered stone slabs, and launched an online educational blog series. Through this update, homeowners, builders, and commercial property managers can coordinate countertop surfaces, custom edge profiles, cabinetry, and flooring through a single local provider.

The operational expansion addresses steady demand for kitchen and bathroom remodeling across the Colorado Springs region. Multi-surface renovation projects frequently require careful scheduling across separate trades, which can complicate construction timelines when cabinetry, flooring, and stone fabrication are handled by different vendors. By unifying material selection, in-house measurement, slab fabrication, removal of existing surfaces, and final placement within one coordinated workflow, SOCO Surfaces enables residential and commercial clients to manage interior updates more efficiently from initial planning through project completion. This integrated scheduling approach also reduces delays between cabinet placement, templating, and final surface installation.

As part of its expanded catalog, SOCO Surfaces supplies four primary countertop materials: granite, quartz, quartzite, and marble. Granite is a natural stone characterized by distinct mineral patterns, offering natural heat tolerance and surface durability. Engineered quartz, produced by combining natural quartz crystals with binding resins, provides a non-porous surface that resists everyday staining and does not require periodic sealing. Quartzite combines the visual movement of natural stone with high resistance to heat and scratching in busy work areas, while marble features classic veining often chosen for bathroom vanities, kitchen islands, and interior accent surfaces.

The expanded service offering covers distinct residential and commercial applications across interior spaces. In residential kitchens, custom countertops are fabricated to accommodate undermount or drop-in sinks,

cooktop cutouts, island overhangs, and backsplash transitions. Bathroom installations focus on vanity tops, double-sink configurations, and moisture-exposed surfaces where stone sealing or non-porous construction helps protect against daily water exposure. For commercial properties, the company fabricates and installs surfaces for reception desks, breakrooms, conference areas, and retail counters that require durable work surfaces capable of handling regular occupancy.

In addition to slab materials, the company provides custom edge profiling and complementary interior installation services. Edge options range from straightforward eased and beveled profiles to bullnose, ogee, and full-height waterfall designs that carry the stone surface vertically down the sides of cabinetry. Clients updating kitchens or bathrooms can also pair new countertops with custom cabinet installation and flooring services available through SOCO Surfaces, selecting cabinet styles and finishes that coordinate directly with chosen stone slabs. Coordinating cabinets, floors, and surfaces concurrently allows technicians to verify cabinet framing, sink cutouts, backsplash transitions, and appliance clearances before fabrication begins.

To assist with material selection and layout planning, SOCO Surfaces hosts project consultations at its Colorado Springs showroom, where full stone slabs and surface finish samples?including polished, honed, and textured options?are displayed for direct inspection. Viewing full slabs rather than small catalog swatches allows property owners and designers to examine natural color variations, veining direction, and surface reflectivity under indoor lighting. Once a material and edge profile are confirmed, technicians complete in-house measurements, fabricate the stone to project specifications, remove old countertops when necessary, and secure the finished surfaces on site.

Alongside its expanded service capacity, SOCO Surfaces has published an informational blog series on its official website. The articles outline practical considerations for renovation planning, including side-by-side comparisons of natural stone and engineered surfaces, recommended sealing intervals and pH-neutral cleaning practices, sink and appliance layout planning, edge profile comparisons, and site preparation steps prior to installation. By making straightforward reference guides available online, the company provides property owners, designers, and facility managers with clear background information on how various countertop materials perform under different levels of routine use.

SOCO Surfaces is an insured, family-owned business serving both residential homeowners and commercial establishments throughout the Colorado Springs area. Its team manages projects ranging from single-bathroom vanity replacements and laundry room counters to full kitchen remodels and commercial workspace installations. Prospective clients interested in viewing available stone slabs, reviewing edge profile samples, or arranging a project consultation can explore options through the company's showroom and official website to coordinate countertop installation in Colorado Springs, CO, for upcoming residential or

commercial renovation projects.
