

Flova Introduces AI Animation Generator That Turns Text or Images into Animated Video

November 16, 2026

SINGAPORE - November 16, 2026 -
Flova, an AI video creation agent operated by Singapore-based Flova Pte. Ltd., has introduced the Flova AI animation generator, a tool that turns a written idea or an existing image into a finished animated video. Available at flova.ai, the generator is built around a conversational agent: users describe a concept in plain language, and the Flova Agent helps develop it into a complete video without the user having to learn production software.

The system combines video models such as Seedance 2.5 with modern language models, which the company says removes the need for a long or technical prompt. Projects can begin from a written idea or from an image the user already owns, including a sketch, a still frame or a character reference. For text-driven projects, the agent can help develop the script, build a storyboard, create each scene and assemble the video, and users can review the results and request changes along the way.

Character consistency is a stated focus of the release. Flova creates a character image from a description,

and users can add reference images covering the face, hair, clothing and colors, then reuse those references throughout a project. According to the product page, this allows the pose, action, camera angle or background to change while the main design of the character stays the same.

Style is handled through Flova Skills, which the company describes as reusable creative methods that guide the agent through a task. The platform lists hundreds of animation Skills powered by Seedance 2.0, Seedance 2.5, MiniMax H3 and other models. Examples on the page include a JoJo-style makeover that turns a photo, scene or object into a 30-second anime short, and a pixel-art memory film of 30 to 60 seconds built from uploaded photos. Creators can also save their own workflows as Skills, and the page says the tool can cover story types such as action, fantasy, romance and comedy.

Editing is designed to stay local to the part that needs work. If a scene does not land, the page says users can rewrite a short section of the plot, change one scene or replace a single shot while the rest of the video remains as it is. Narration and music can be added and aligned with the storyboard and timeline, with order, timing and volume adjustable before export.

Finished projects can be exported without a watermark in 480p, 720p, 1080p or 4K, or saved to an Asset Library for later use. The company points to several groups of users, including storytellers, social media creators, game teams building demos and trailers, and VTubers who need intro videos and character clips. For marketing, the company says small brands and game teams can use the Flova AI animation generator to turn a feature list, a game mechanic or a launch concept into a scripted clip.

Access runs through accounts and credits. Flova Credits are the platform's standard usage unit and are deducted according to the selected model, generation duration, resolution and other settings. Plans are offered on monthly, quarterly and yearly terms, with Personal plans for individual creators and Team plans for studios and marketing teams, and available models, concurrency limits and capacity vary by plan tier. Commercial use is included with eligible plans, though users must confirm they have permission to use uploaded materials.

About FLOVA PTE. LTD.:

Flova.ai is an AI?native video creation platform under FLOVA PTE. LTD., focused on Agent?driven production workflows. Launched globally in October 2025, the platform combines leading AI image and video models with project memory, contextual understanding, intelligent asset management, timeline workflows, and reusable Skills.

Flova was founded by Guo Lie, creator of FaceU and former head of ByteDance?s imaging business. FaceU was acquired by ByteDance for approximately US$300 million in 2018, and Guo subsequently participated in

incubating products including CapCut, Hypic, and BeautyCam. Flova has raised over US$80 million across two funding rounds, backed by Sequoia Capital, IDG Capital, and Sky9 Capital.
