Green Bay Plastics Expands Availability of Blow Molded Custom Plastic Jars for Dry Goods Brands

November 17, 2026

GREEN BAY, WI - November 17, 2026 -
Green Bay Plastics, a Wisconsin-based family-owned blow molding manufacturer, announced today that it has production capacity available for new custom plastic jars projects. The company is accepting orders from brands and packagers that need wide-mouth jars and canisters designed for dry goods, granular products, and home goods.

The announcement comes as consumer packaged goods companies continue to reassess packaging suppliers, lead times, and inventory strategies heading into 2027. Many brand owners have sought domestic sources for rigid plastic packaging to shorten transit times and simplify supply chain management. Green Bay Plastics is making its available capacity open to both new product launches and existing programs that need additional or replacement supply.

"Brands have told us that finding a dependable partner for custom jars has been harder than it should be," said Michael Hogan, President of Green Bay Plastics. "We have open capacity on our lines right now, which means we can take on new jar programs, whether a company needs a first run of a few thousand units or an ongoing supply measured in the millions."

Green Bay Plastics manufactures custom plastic jars in capacities ranging from 2 ounces to 9 quarts, along with canisters from 36 to 100 ounces. Each jar can be engineered to a customer's specifications, including capacity, wall thickness, and mouth and neck size. Wide-mouth designs support scooping and quick pouring of bulk dry goods, while narrower neck finishes allow for more controlled dispensing.

Order quantities begin at 3,000 units and scale to runs of several million units. This range allows emerging brands, private label programs, and established manufacturers to work with the same supplier as their volume grows. The company's engineering team works with customers through the design and development stages before a container moves into full production.

Green Bay Plastics produces its containers through blow molding, a manufacturing process widely used for high-density polyethylene (HDPE) bottles, jars, and handled containers. HDPE is valued in rigid packaging for its durability, moisture resistance, and compatibility with a broad range of dry and household products. It is also one of the most commonly accepted plastic resins in curbside recycling programs across the United States.

In addition to molding, the company offers value-added services intended to reduce the number of handoffs in a customer's supply chain. These services include custom labeling for branding and product information, cap installation, and on-site reshipping and cartoning. The company also produces custom packaging materials on site, which can help customers coordinate branding and streamline distribution.

"Every extra stop between the molding line and the filling line adds cost and risk," Hogan said. "When we can mold the jar, apply the label, install the closure, and pack it out for shipment under one roof, our customers spend less time managing vendors and more time focused on their own products."

Custom jars and canisters from Green Bay Plastics are suited to a range of applications, including dry ingredients, powders, granular products, and other household goods. Design options can be tailored for long-term storage, easy handling, and shelf presentation. The company notes that a well-designed jar can offer the convenience of a handled container while presenting a cleaner retail appearance.

Available capacity is particularly relevant for companies planning product launches, line extensions, or packaging redesigns in the coming months. Securing tooling and production slots early can help brands hold to launch timelines and avoid delays associated with constrained supply.

Green Bay Plastics has been designing and manufacturing custom plastic containers for generations. As a family-owned business, the company has built its operations around long-term customer relationships, consistent production quality, and responsive service. Its product lines include HDPE bottles, handled

containers, jars, and molded components, supported by custom blow molding as well as labeling and packing services.
