Ledo Aesthetics Describes Its Use of Ultrasound in Facial Balancing

November 20, 2026

WESTWOOD, NJ - November 20, 2026 -
Ledo Aesthetics uses ultrasound as part of its non-surgical facial balancing service in Westwood, New Jersey. The practice develops individualized plans for the service, which address how features such as the chin, lips, and jawline relate to the overall shape of the face.

Facial balancing takes facial proportions into account when considering which areas to address. A plan may involve the chin, lips, or jawline, depending on the person's facial structure and stated goals. The practice uses ultrasound within this service, which can involve non-surgical procedures using injectables.

For clients comparing medical spas in Tenafly, NJ, with practices in other communities, Ledo Aesthetics provides facial balancing at its Westwood office. Facial balancing plans can address concerns about proportions, asymmetry, or areas of volume loss. Those concerns inform the areas that may be included in an individual treatment plan.

An uneven smile or a concern about the proportions of the lips can be part of a discussion about facial balancing. Other concerns may involve changes in facial volume or in facial proportions with age. The practice considers each concern in the context of the person's facial structure.

Each new client begins with a one-on-one consultation. During that discussion, the practice considers the person's goals and medical history when determining whether a procedure is appropriate. It also explains what the proposed treatment involves and what the client can expect during the course of care. The practice considers skin type and comfort level.

Planning can focus on the relationship between a specific feature and the rest of the face. The chin and jawline are among the areas the practice may consider together when discussing proportions. A person's goals and facial structure inform which areas the plan addresses and which options the practice discusses.

The procedures considered in an individual plan can include injectables. Ledo Aesthetics offers more than

one injectable option within its facial balancing service. A plan can include a combination of procedures, with the options chosen according to the person's goals and the areas of the face the plan addresses.

Preparation guidance varies with the procedure under consideration. The practice provides instructions specific to the treatment and explains what clients can expect before the procedure. Its general preparation guidance includes arriving with skin free of makeup or lotions.

Licensed medical professionals perform procedures at Ledo Aesthetics. The practice says its clinicians design and supervise treatments and explain what to expect during a consultation. For facial balancing, that discussion gives the client an opportunity to address concerns about individual features and ask about the procedures being considered.

Ledo Aesthetics provides facial balancing through its Westwood practice for clients who may also consider medical spas in Tenafly, NJ. The practice gives clients aftercare instructions following facial balancing procedures. It also discusses follow-up visits and maintenance where relevant to the type of treatment provided.

The Westwood office accepts scheduling requests by phone and through its online contact form. The practice says appointment availability for facial balancing is typically within one to two business days.

Ledo Aesthetics is a locally owned, family-owned practice that is woman-owned and owner-operated. The team reports more than 20 years of clinical experience. Facial balancing is part of the practice's non-surgical aesthetic services, with the use of ultrasound and the selection of procedures described as part of its individualized approach.
